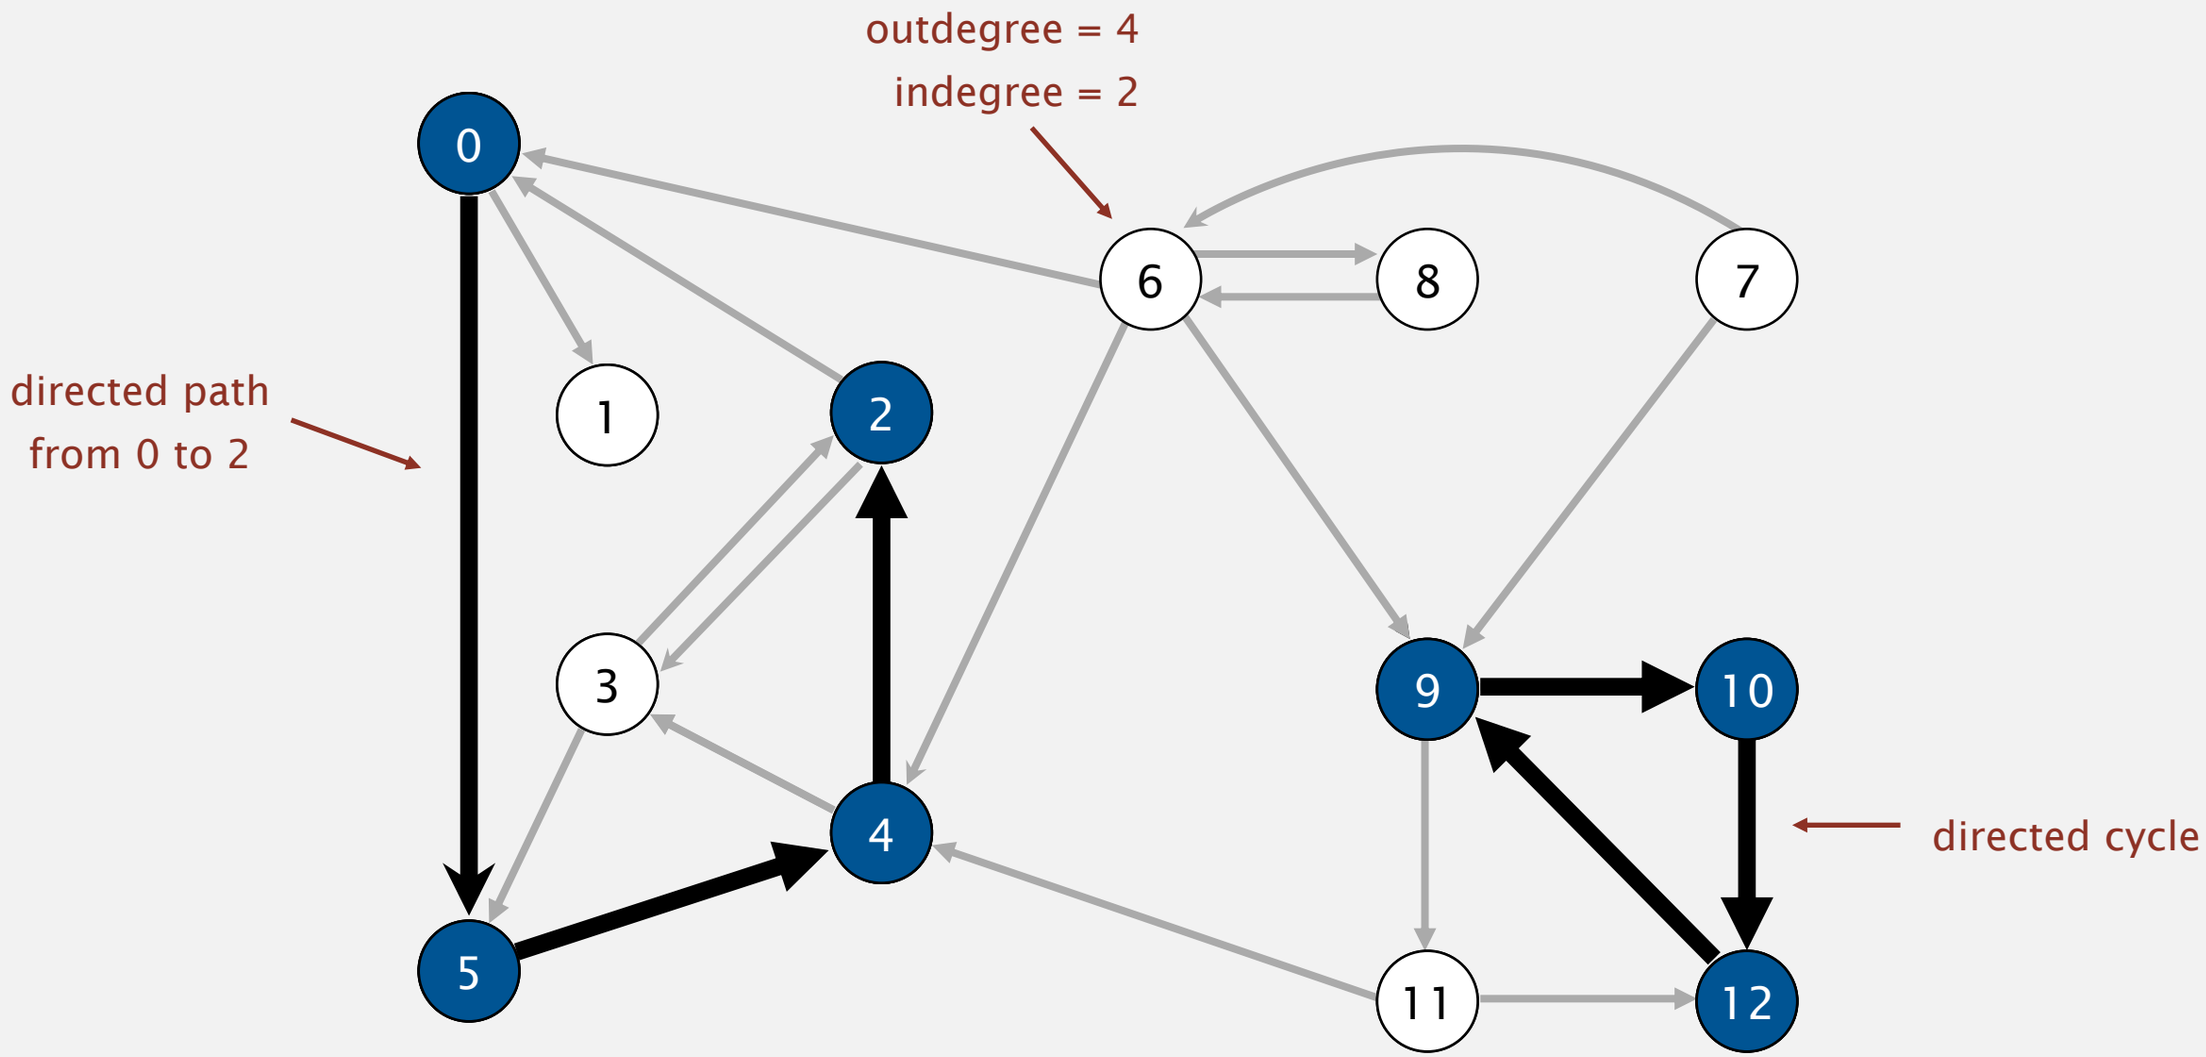
Digraph applications

digraph	vertex	directed edge
transportation	street intersection	one-way street
web	web page	hyperlink
food web	species	predator–prey relationship
WordNet	synset	hypernym
scheduling	task	precedence constraint
financial	bank	transaction
cell phone	person	placed call
infectious disease	person	infection
game	board position	legal move
citation	journal article	citation
object graph	object	pointer
inheritance hierarchy	class	inherits from
control flow	code block	jump

Directed graph terminology

LO 9B.1, 9B.2, 9B.5

Digraph. Set of vertices connected pairwise by directed edges.



Some digraph problems

problem	description
s-t path	*Is there a path from s to t ?*
shortest s-t path	*What is the shortest path from s to t ?*
directed cycle	*Is there a directed cycle in the graph ?*
topological sort	*Can the digraph be drawn so that all edges point upwards?*
strong connectivity	*Is there a directed path between every pairs of vertices ?*
transitive closure	*For which vertices v and w is there a directed path from v to w ?*
PageRank	*What is the importance of a web page ?*

Directed Graphs

- *digraph API*
- *depth-first search*
- *breadth-first search*
- *topological sort*

Digraph API

Almost identical to Graph API.

public class Digraph		
	Digraph(int V)	*create an empty digraph with V vertices*
	Digraph(In in)	*create a digraph from input stream*
void	addEdge(int v, int w)	*add a directed edge v→w*
Iterable<Integer>	adj(int v)	*vertices adjacent from v*
int	V()	*number of vertices*
int	E()	*number of edges*
Digraph	reverse()	*reverse of this digraph*
String	toString()	*string representation*

Digraph API

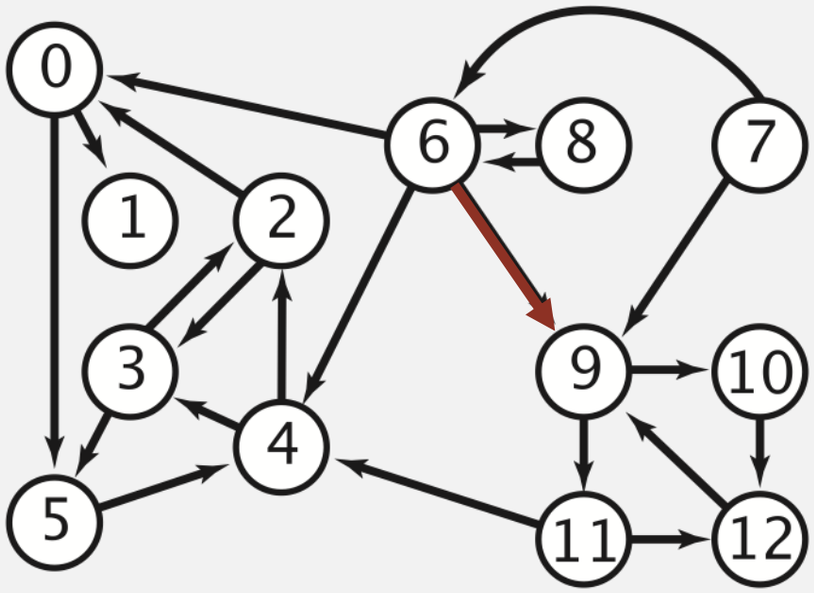
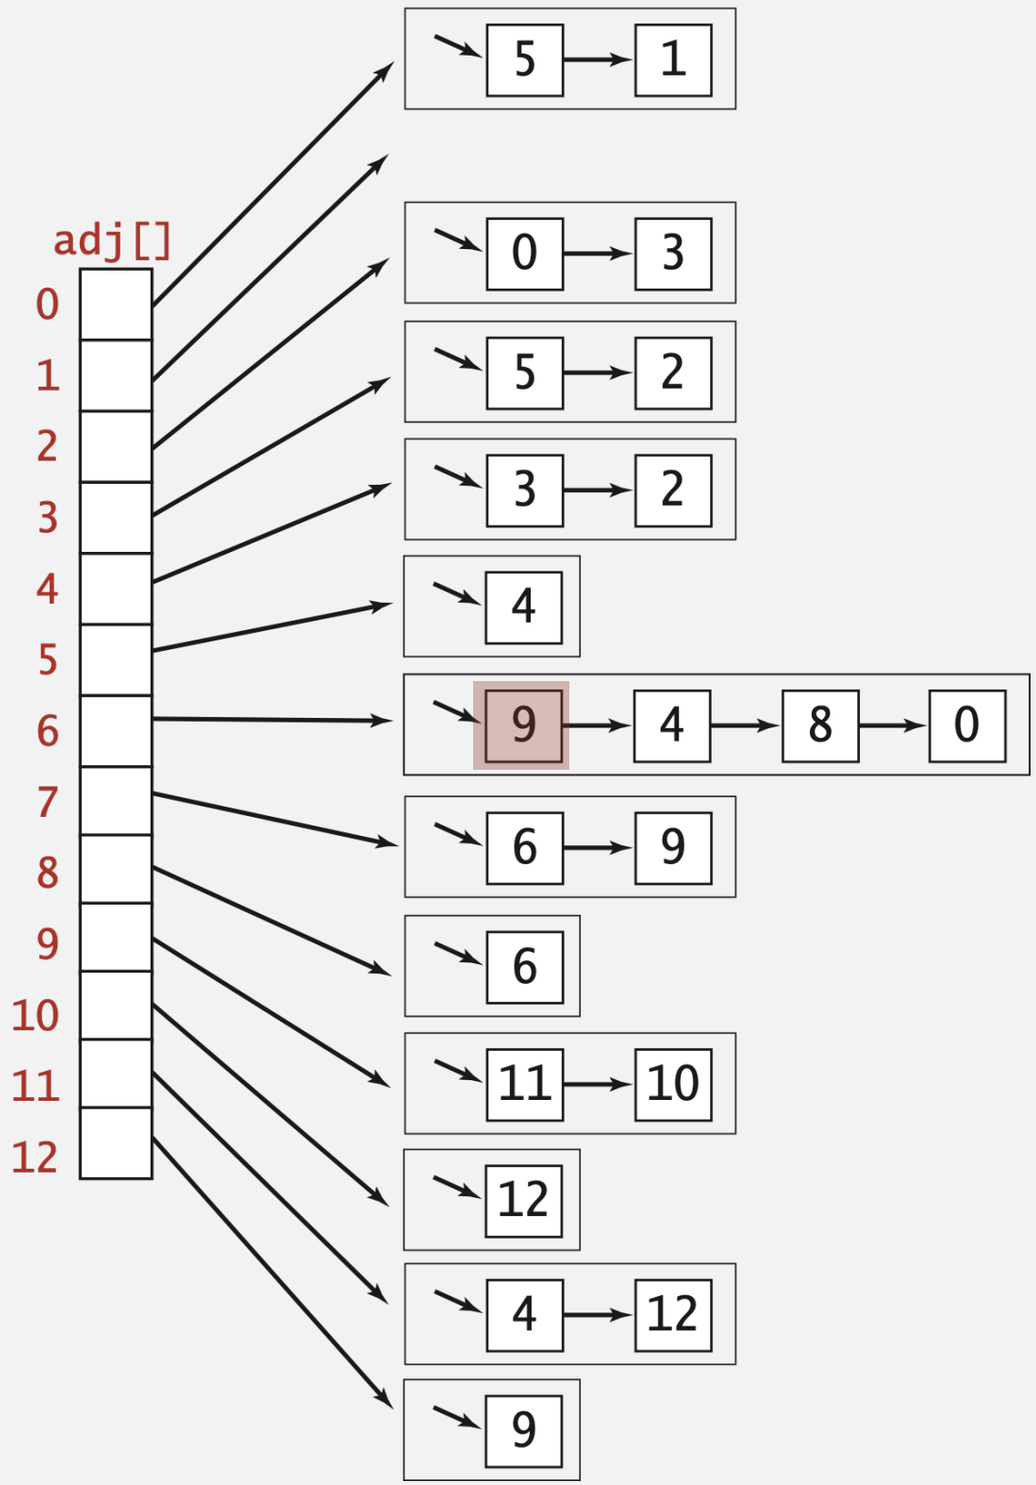
Space consumption: V^2

Note: parallel edges disallowed

Digraph representation: adjacency lists

Maintain vertex-indexed array of lists.





Assuming a linked list to store the adjacency list.

Space consumption: **V + 2E**

2 units per node: the vertex and the next pointer.

Directed graphs: quiz 1

LO 9B.7

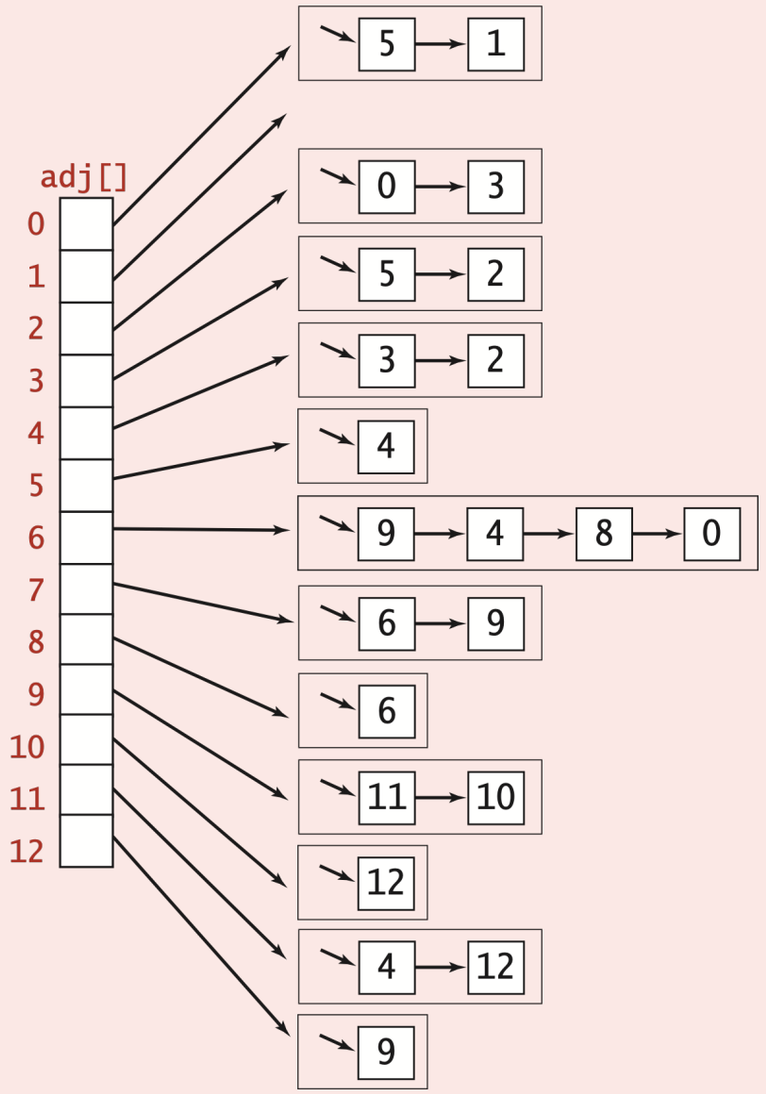
Which is order of growth of running time of removing an edge v→w from a digraph uses the adjacency-lists representation, where V is the number of vertices and E is the number of edges?

A. 1

B. $outdegree(v)$

C. $indegree(w)$

D. $outdegree(v) + indegree(w)$



Directed graphs: quiz 2

Which is order of growth of running time of the following code fragment if the digraph uses the adjacency-lists representation, where V is the number of vertices and E is the number of edges?

A. V

B. $E + V$

C. V^2

D. $V E$

```
for (int v = 0; v < G.V(); v++)
   for (int w : G.adj(v))
      StdOut.println(v + "->" + w);
```

prints each edge exactly once

Digraph representations

In practice. Use adjacency-lists representation.

- Algorithms based on iterating over vertices adjacent from v.
- Real-world graphs tend to be sparse (not dense).

proportional to V edges

proportional to V^2 edges

representation	space	insert edgefrom v to w	edge from v to w?	iterate over vertices adjacent from v?
list of edges	E	1	E	E
adjacency matrix	V^2	1 †	1	V
adjacency lists	$E + V$	1	$outdegree(v)$	$outdegree(v)$

† disallows parallel edges

Adjacency-lists graph representation (review): Java implementation

```
public class Graph
{
   private final int V;
   private Bag<Integer>[] adj;

   public Graph(int V)
   {
     this.V = V;
     adj = (Bag<Integer>[]) new Bag[V];
     for (int v = 0; v < V; v++)
        adj[v] = new Bag<Integer>();
   }

   public void addEdge(int v, int w)
   {
     adj[v].add(w);
     adj[w].add(v);
   }

   public Iterable<Integer> adj(int v)
   {  return adj[v];  }
```

adjacency lists

create empty graph with V vertices

add edge v-w

iterator for vertices adjacent to v

Adjacency-lists digraph representation: Java implementation

```
public class Digraph
{
   private final int V;
   private Bag<Integer>[] adj;

   public Digraph(int V)
   {
     this.V = V;
     adj = (Bag<Integer>[]) new Bag[V];
     for (int v = 0; v < V; v++)
        adj[v] = new Bag<Integer>();
   }

   public void addEdge(int v, int w)
   {
     adj[v].add(w);

   }

   public Iterable<Integer> adj(int v)
   {  return adj[v];  }
```

adjacency lists

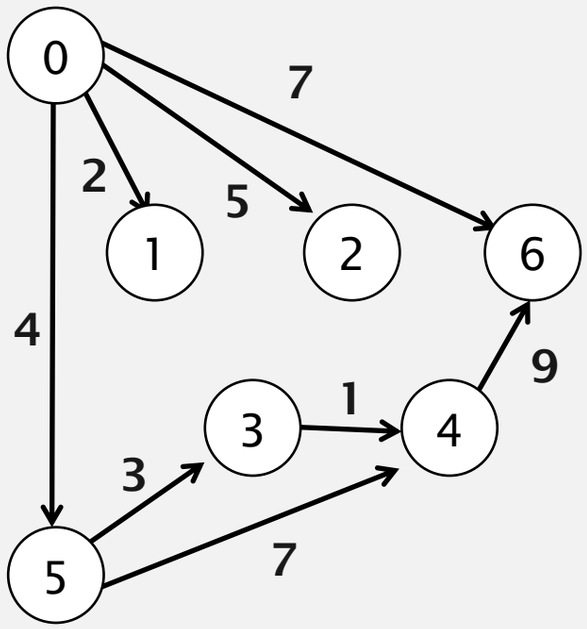
create empty digraph with V vertices

add edge v→w

iterator for vertices adjacent from v

Weighted Digraph

Edges have a **cost** associated with them.



The cost of path 0, 6 is 7

The cost of path 0, 5, 4 is 11

The cost of path 0, 5, 3, 4, 6 is 17

The **shortest path** from 0 to 6 is 7

Less expensive path

Digraph representation: adjacency matrix

Maintain a two-dimensional V-by-V array;

for each edge $v \rightarrow w$ in graph: adj[v][w] = **edge cost or value**.

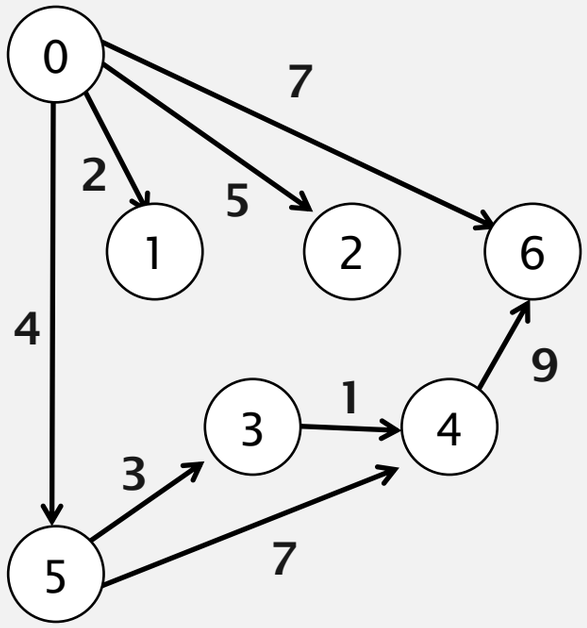
	0	1	2	3	4	5	6
0	0	2	5	0	0	4	7
1	0	0	0	0	0	0	0
2	0	0	0	0	0	0	0
3	0	0	0	0	1	0	0
4	0	0	0	0	0	0	9
5	0	0	0	3	7	0	0
6	0	0	0	0	0	0	0

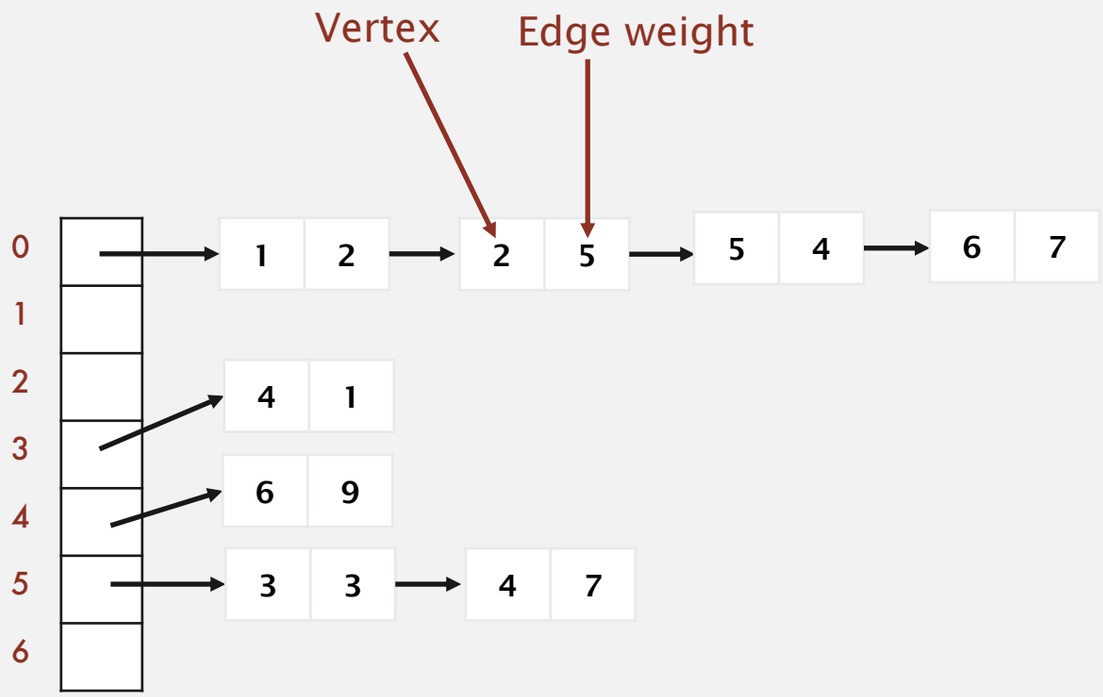
Space consumption: V^2

Graph representation: adjacency lists

Maintain vertex-indexed array of lists.

Add edge weight to node.





Assuming a linked list to store the adjacency list.

Space consumption: **V + 3E**

3 units per node: the vertex, the edge weight, and the next pointer.

Directed graphs: quiz 4

What is the maximum number of edges on a Graph of V vertices?

A. $V * (V - 1) / 2$

B. $E + V$

C. V^2

D. $V E$

E. $V * (V - 1)$

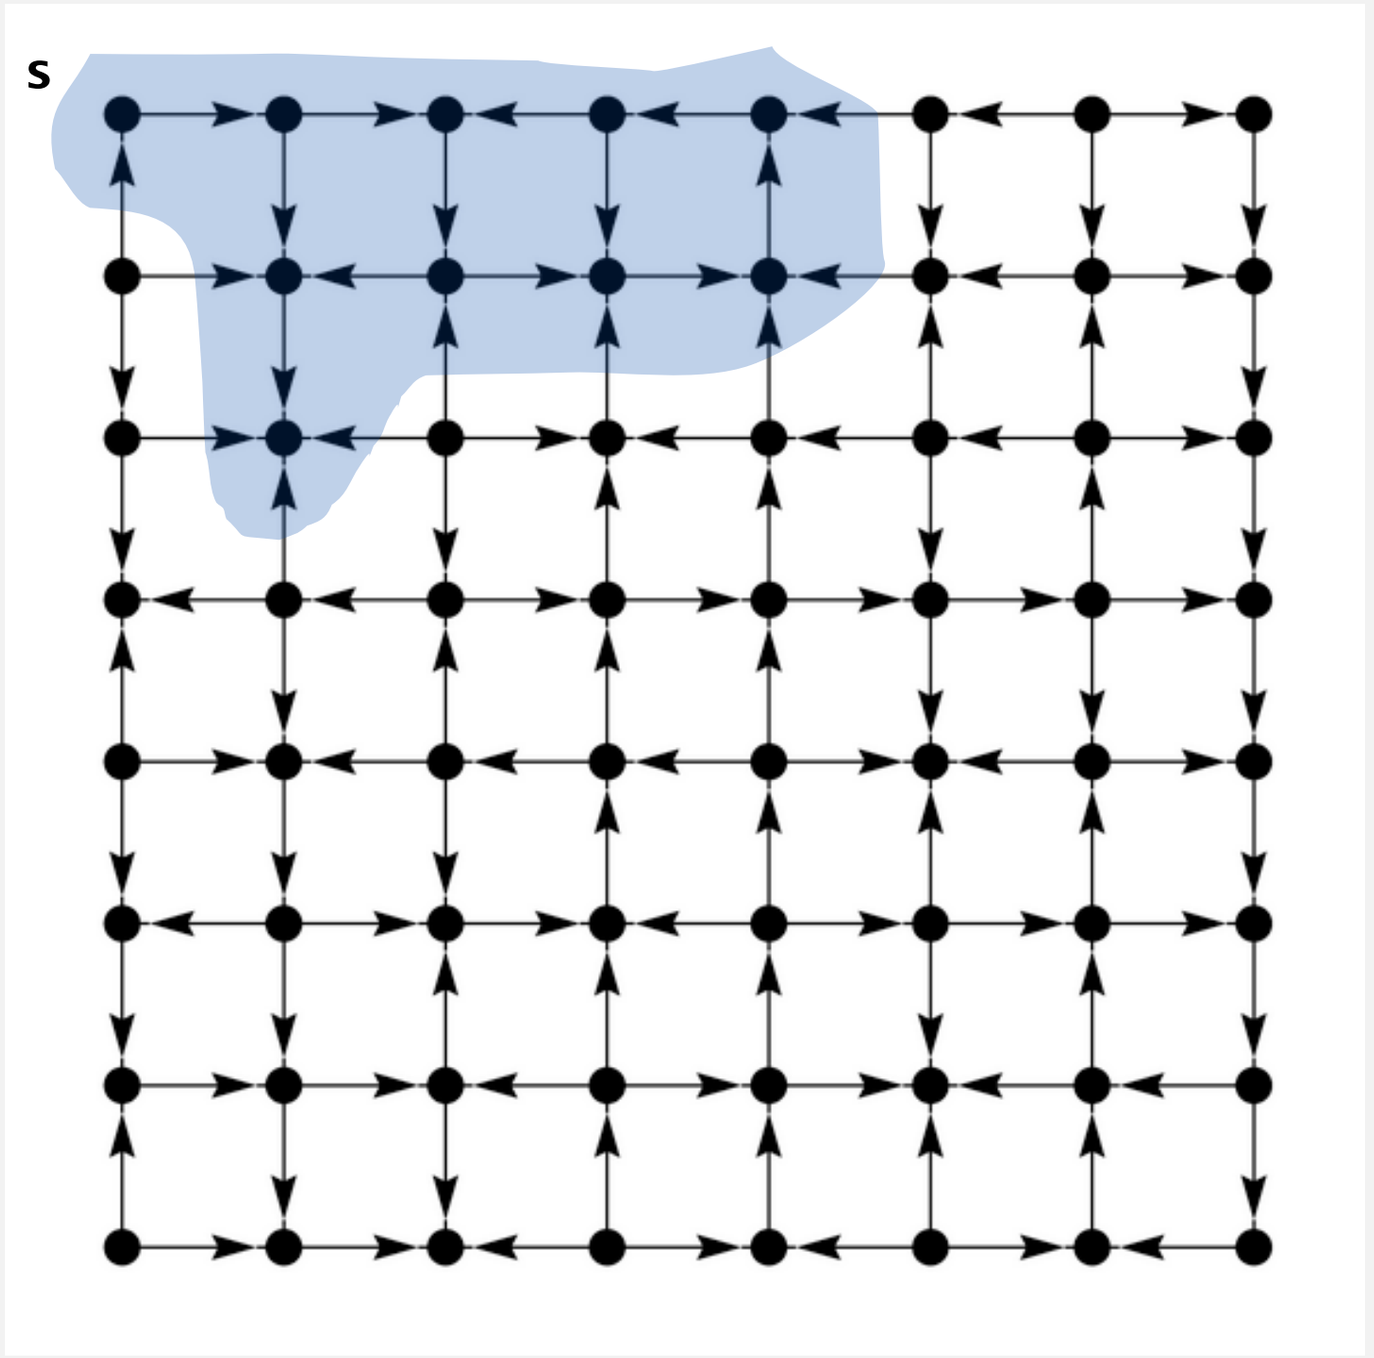
Reachability

Problem. Find all vertices reachable from s along a directed path.



Depth-first search in digraphs

Same method as for undirected graphs.

- Every undirected graph is a digraph (with edges in both directions).
- DFS is a digraph algorithm.

DFS (to visit a vertex v)

Mark vertex v.

Recursively visit all unmarked vertices w adjacent from v.

Depth-first search demo

To visit a vertex v :

- Mark vertex v as visited.
- Recursively visit all unmarked vertices adjacent from v.

10	F	-
11	F	-
12	F	-

reachable from 0

Depth-first search (in undirected graphs)

Recall code for undirected graphs.

```
public class DepthFirstSearch
{
   private boolean[] marked;

   public DepthFirstSearch(Graph G, int s)
   {
     marked = new boolean[G.V()];
     dfs(G, s);
   }

   private void dfs(Graph G, int v)
   {
     marked[v] = true;
     for (int w : G.adj(v))
        if (!marked[w])
           dfs(G, w);
   }

   public boolean visited(int v)
   {  return marked[v];  }
}
```

true if connected to s

constructor marks vertices connected to s

recursive DFS does the work

client can ask whether any vertex is connected to s

Depth-first search (in directed graphs)

Code for directed graphs identical to undirected one.

```
public class DirectedDFS
{
  private boolean[] marked;

  public DirectedDFS(Digraph G, int s)
  {
    marked = new boolean[G.V()];
    dfs(G, s);
  }

  private void dfs(Digraph G, int v)
  {
    marked[v] = true;
    for (int w : G.adj(v))
      if (!marked[w])
        dfs(G, w);
  }

  public boolean visited(int v)
  {  return marked[v];  }
}
```

true if connected to s

constructor marks vertices connected to s

recursive DFS does the work

client can ask whether any vertex is connected to s

Reachability application: program control-flow analysis

LO 9B.11, 9B.13

Every program is a digraph.

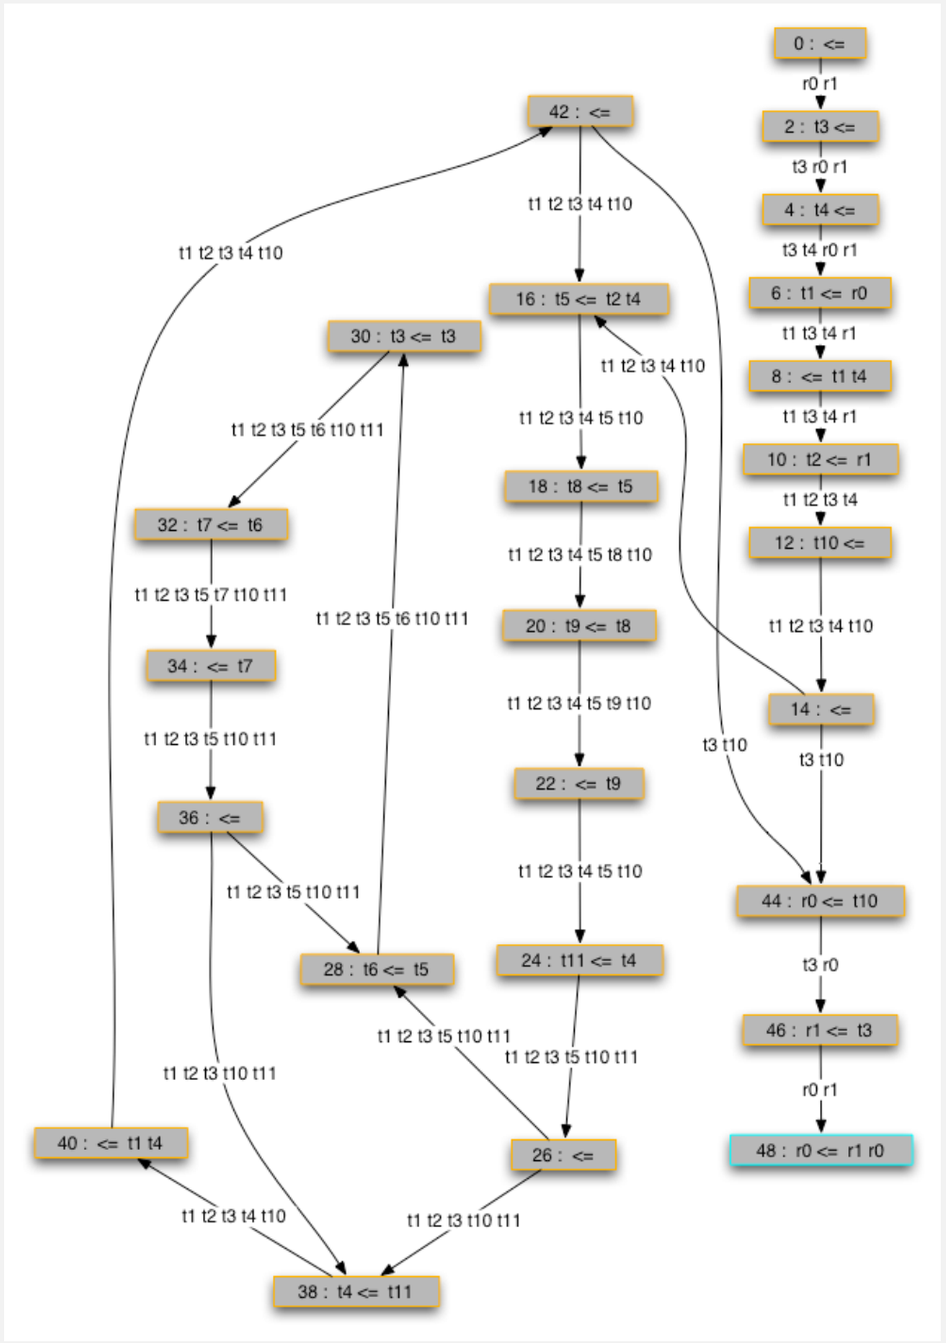
- Vertex = basic block of instructions (straight-line program).
- Edge = jump.

Dead-code elimination.

Find (and remove) unreachable code.

Infinite-loop detection.

Determine whether exit is unreachable.



Reachability application: mark-sweep garbage collector

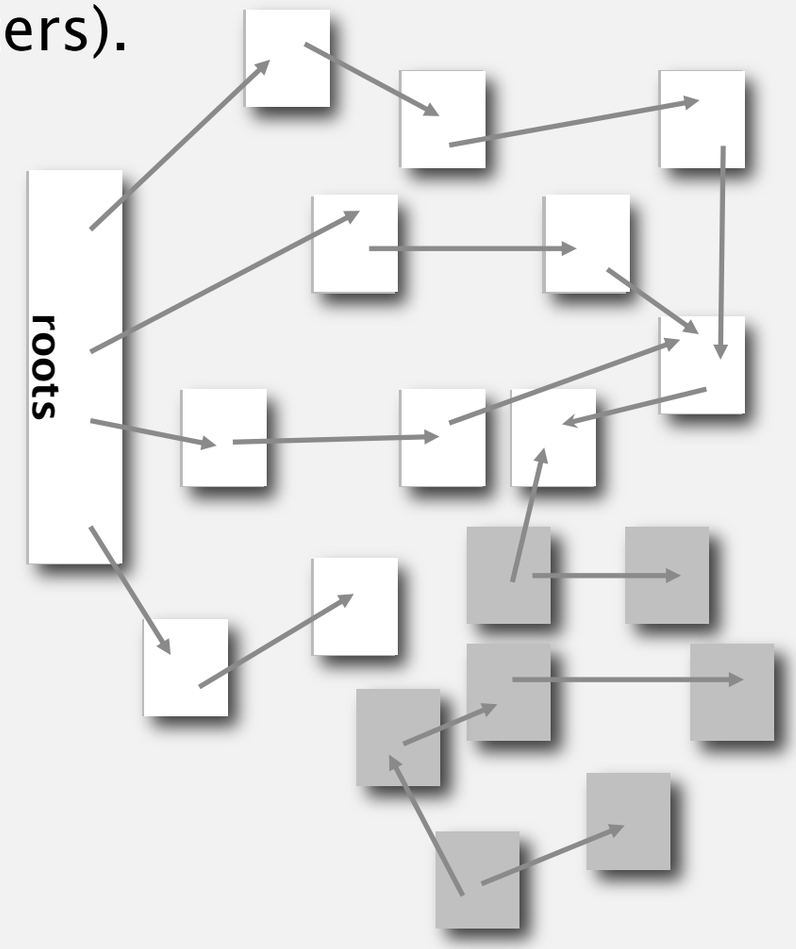
LO 9B.11, 9B.13

Every data structure is a digraph.

- Vertex = object.
- Edge = reference.

Roots. Objects known to be directly accessible by program (e.g., stack).

Reachable objects. Objects indirectly accessible by program (starting at a root and following a chain of pointers).

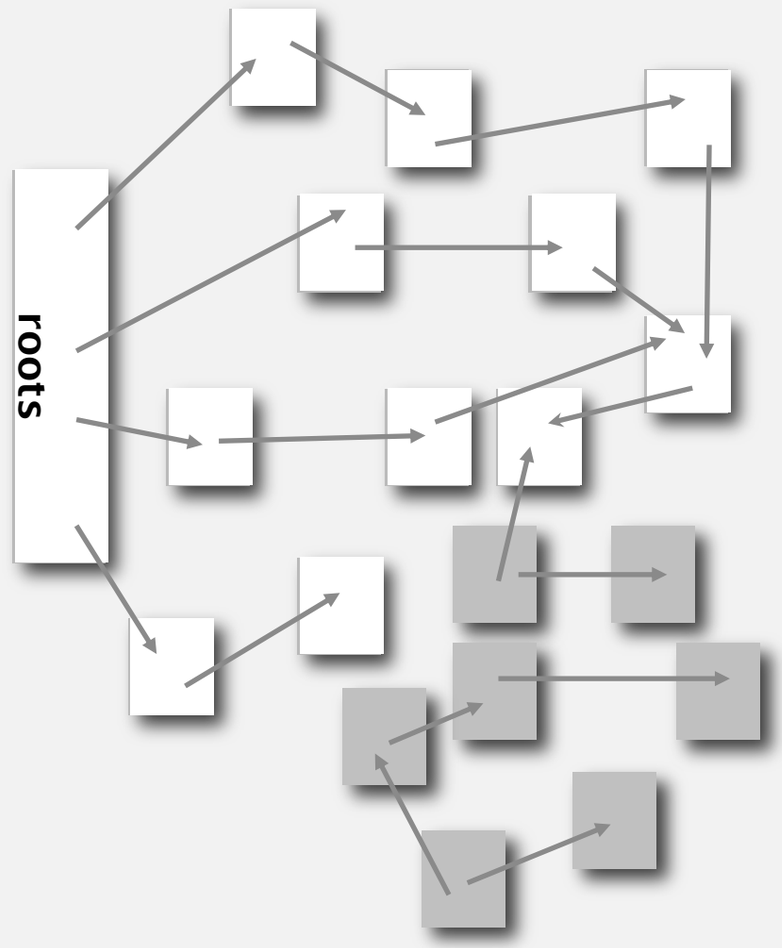


Reachability application: mark-sweep garbage collector

Mark-sweep algorithm. [McCarthy, 1960]

- Mark: mark all reachable objects.
- Sweep: if object is unmarked, it is garbage (so add to free list).

Memory cost. Uses 1 extra mark bit per object (plus DFS stack).



Depth-first search in digraphs summary

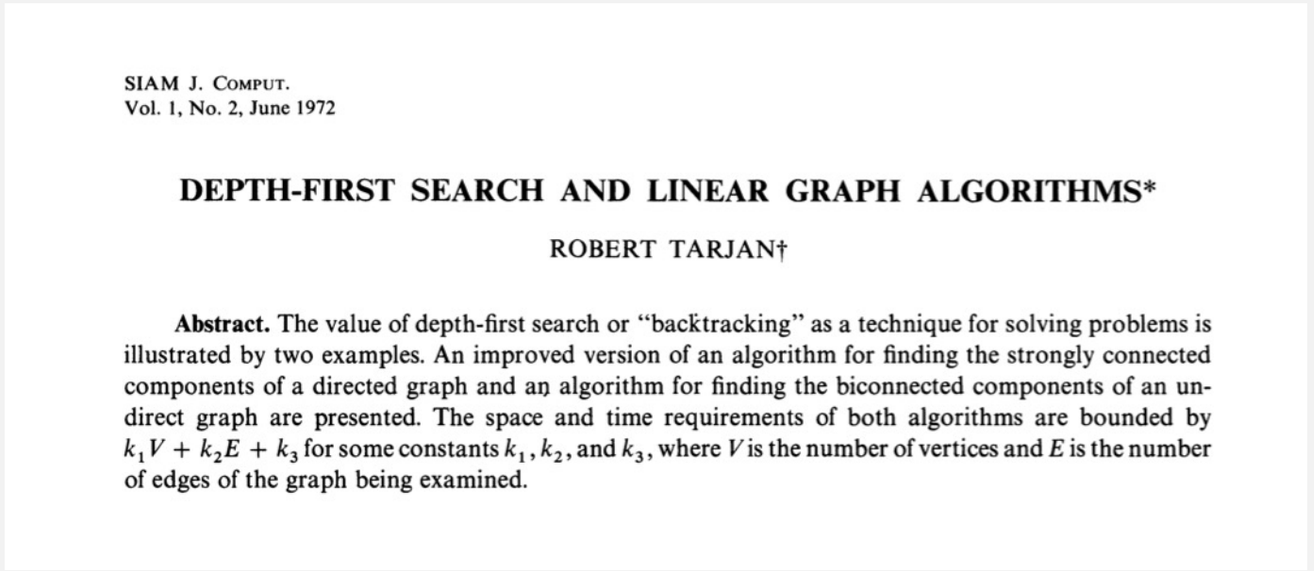
LO 9B.11, 9B.13

DFS enables direct solution of simple digraph problems.

- ✓ Reachability.
- Path finding.
- Topological sort.
- Directed cycle detection.

Basis for solving difficult digraph problems.

- 2-satisfiability.
- Directed Euler path.
- Strongly-connected components.



SIAM J. COMPUT.
Vol. 1, No. 2, June 1972

DEPTH-FIRST SEARCH AND LINEAR GRAPH ALGORITHMS*

ROBERT TARJAN†

Abstract. The value of depth-first search or "backtracking" as a technique for solving problems is illustrated by two examples. An improved version of an algorithm for finding the strongly connected components of a directed graph and an algorithm for finding the biconnected components of an undirect graph are presented. The space and time requirements of both algorithms are bounded by $k_1V + k_2E + k_3$ for some constants k_1, k_2, and k_3, where V is the number of vertices and E is the number of edges of the graph being examined.

Directed graphs: quiz 3

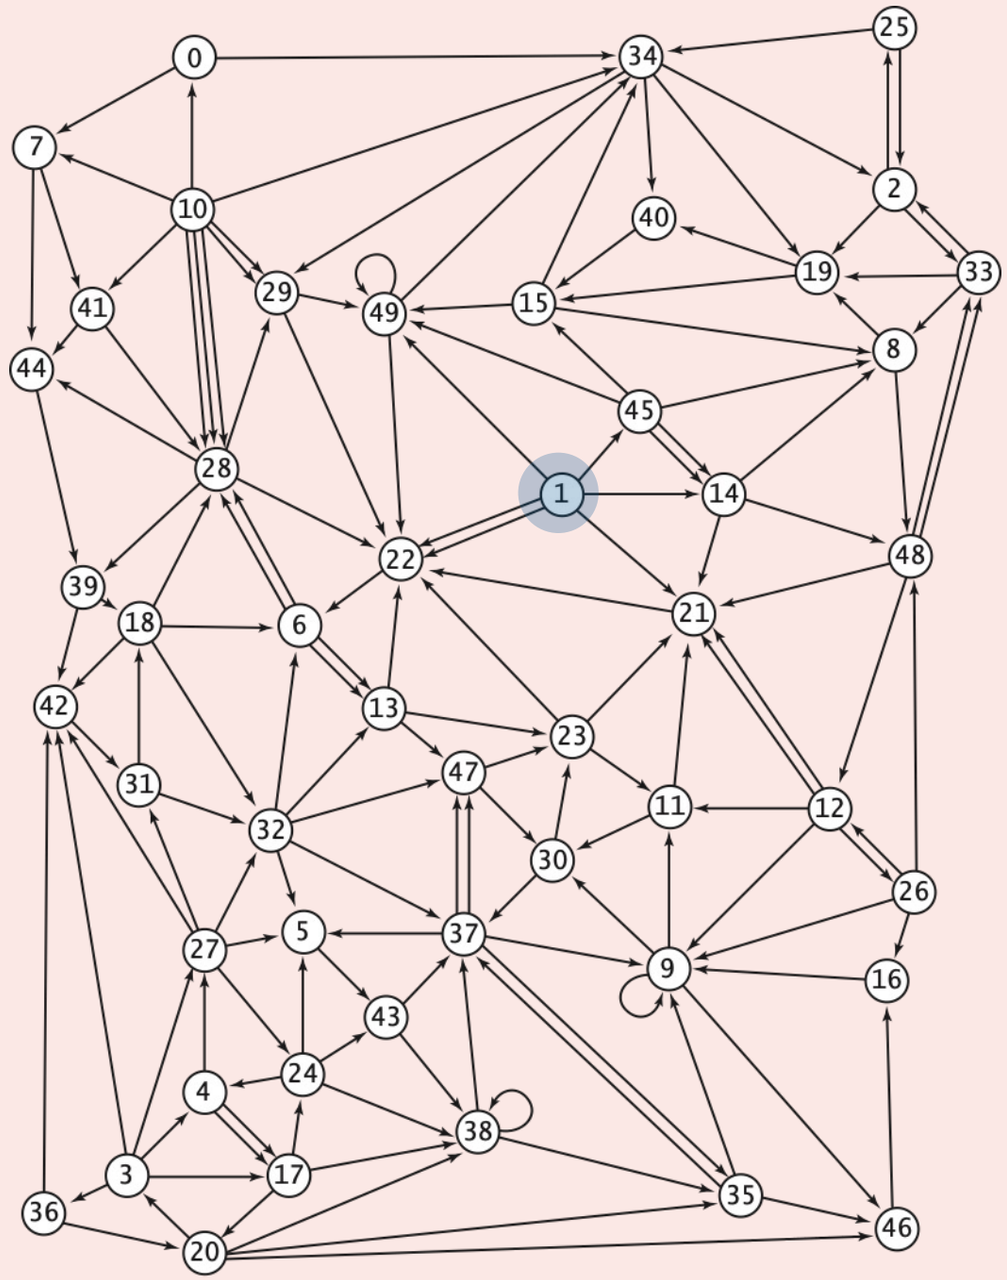
Suppose that you want to design a web crawler. Which graph search algorithm should you use?

A. depth-first search

B. breadth-first search

C. either A or B

D. neither A nor B



Web crawler output (an example)

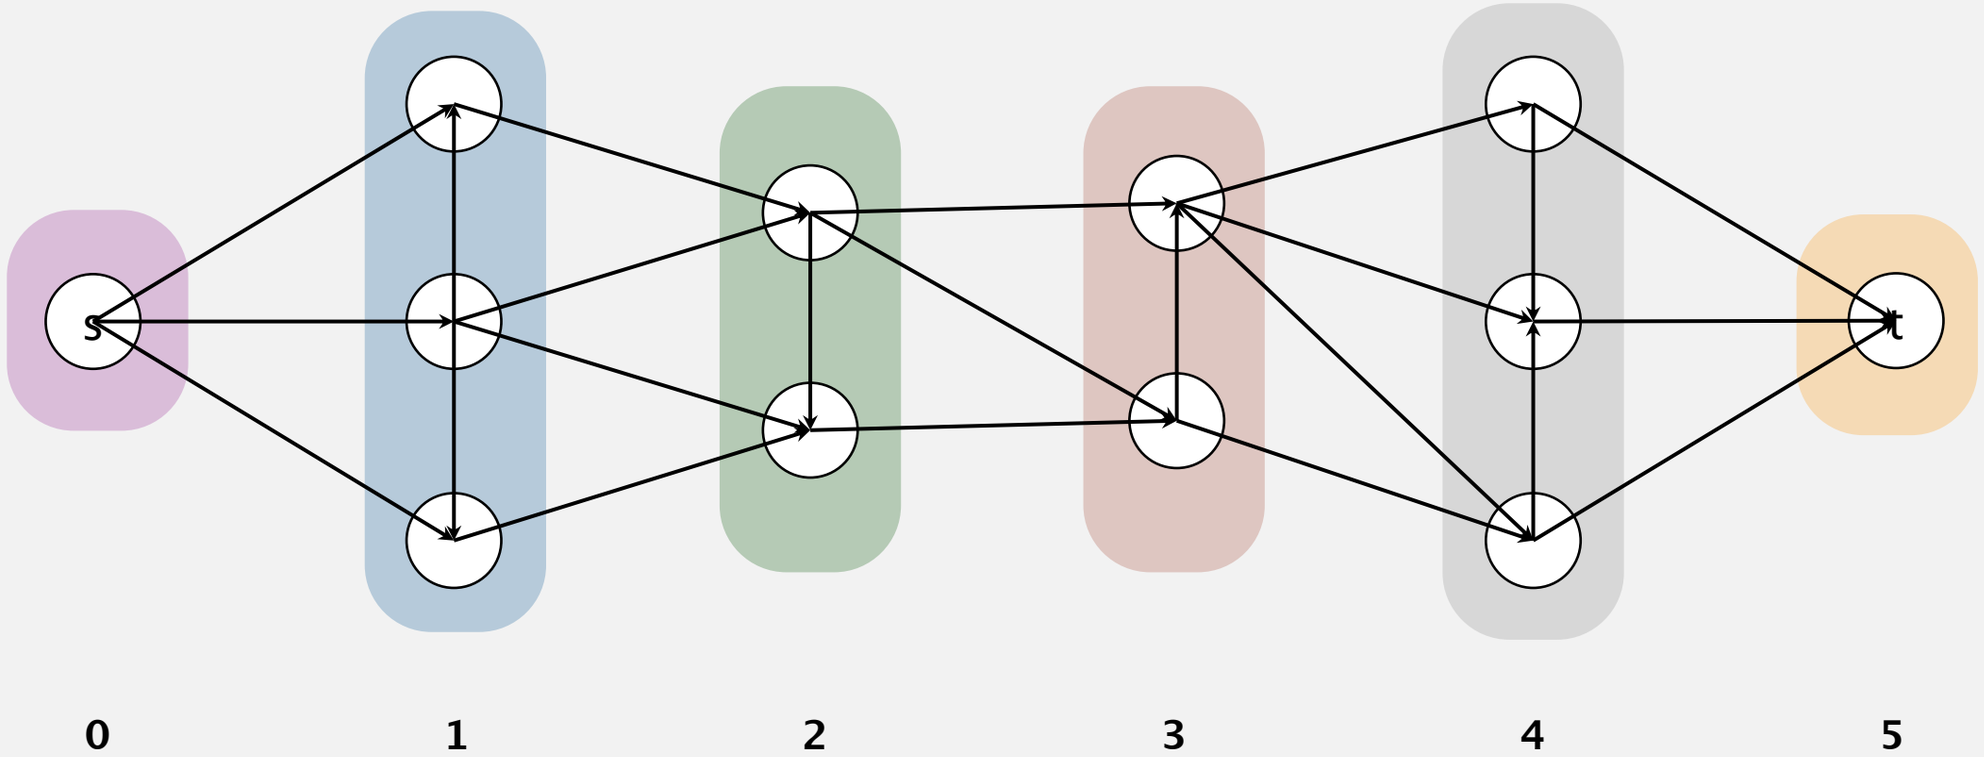
Directed Graphs

- *introduction*
- *digraph API*
- *depth-first search*
- *breadth-first search*
- *topological sort*

Shortest directed paths

Problem. Find directed path from s to each vertex that uses fewest edges.



Breadth-first search in digraphs

Same method as for undirected graphs.

- Every undirected graph is a digraph (with edges in both directions).
- BFS is a digraph algorithm.

BFS (from source vertex s)

Put s onto a FIFO queue, and mark s as visited.

Repeat until the queue is empty:

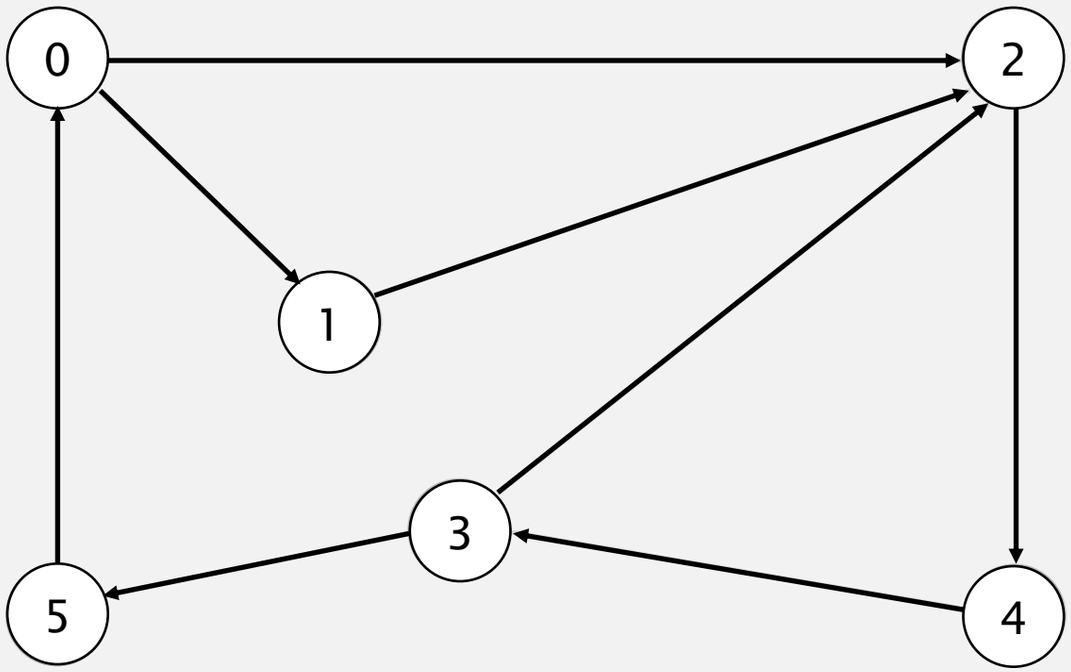
- **remove the least recently added vertex v**
- **for each unmarked vertex adjacent from v:**
  add to queue and mark as visited.

Proposition. BFS computes directed path with fewest edges from s to each vertex in time proportional to $E + V$.

Directed breadth-first search demo

Repeat until queue is empty:

- Remove vertex v from queue.
- Add to queue all unmarked vertices adjacent from v and mark them.



graph G

tinyDG2.txt

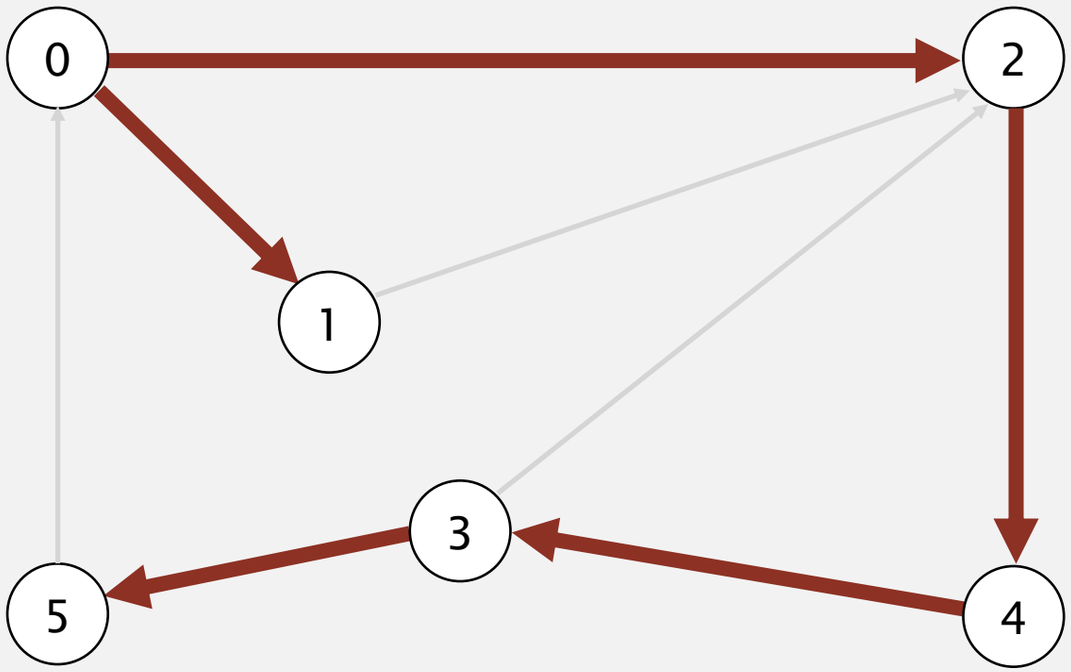
3 2
1 2
0 1
4 3
3 5
0 2
```

Directed breadth-first search demo

LO 9B.10

Repeat until queue is empty:

- Remove vertex v from queue.
- Add to queue all unmarked vertices adjacent from v and mark them.



v	edgeTo[]	distTo[]
0	-	0
1	0	1
2	0	1
3	4	3
4	2	2
5	3	4

done

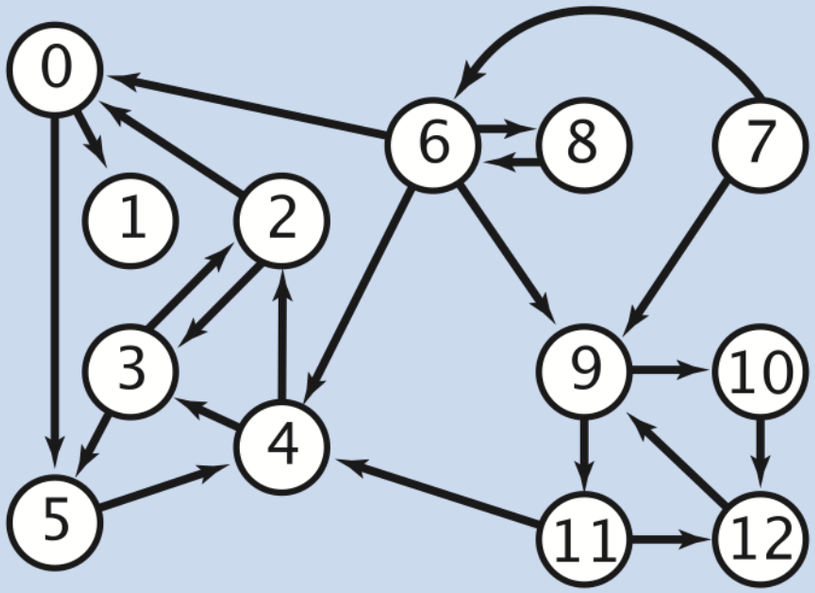
Multiple-source shortest paths (optional)

LO 9B.14

Given a digraph and a set of source vertices, find shortest path from any vertex in the set to every other vertex.

Ex. $S = \{ 1, 7, 10 \}$.

- Shortest path to 4 is $7 \rightarrow 6 \rightarrow 4$.
- Shortest path to 5 is $7 \rightarrow 6 \rightarrow 0 \rightarrow 5$.
- Shortest path to 12 is $10 \rightarrow 12$.



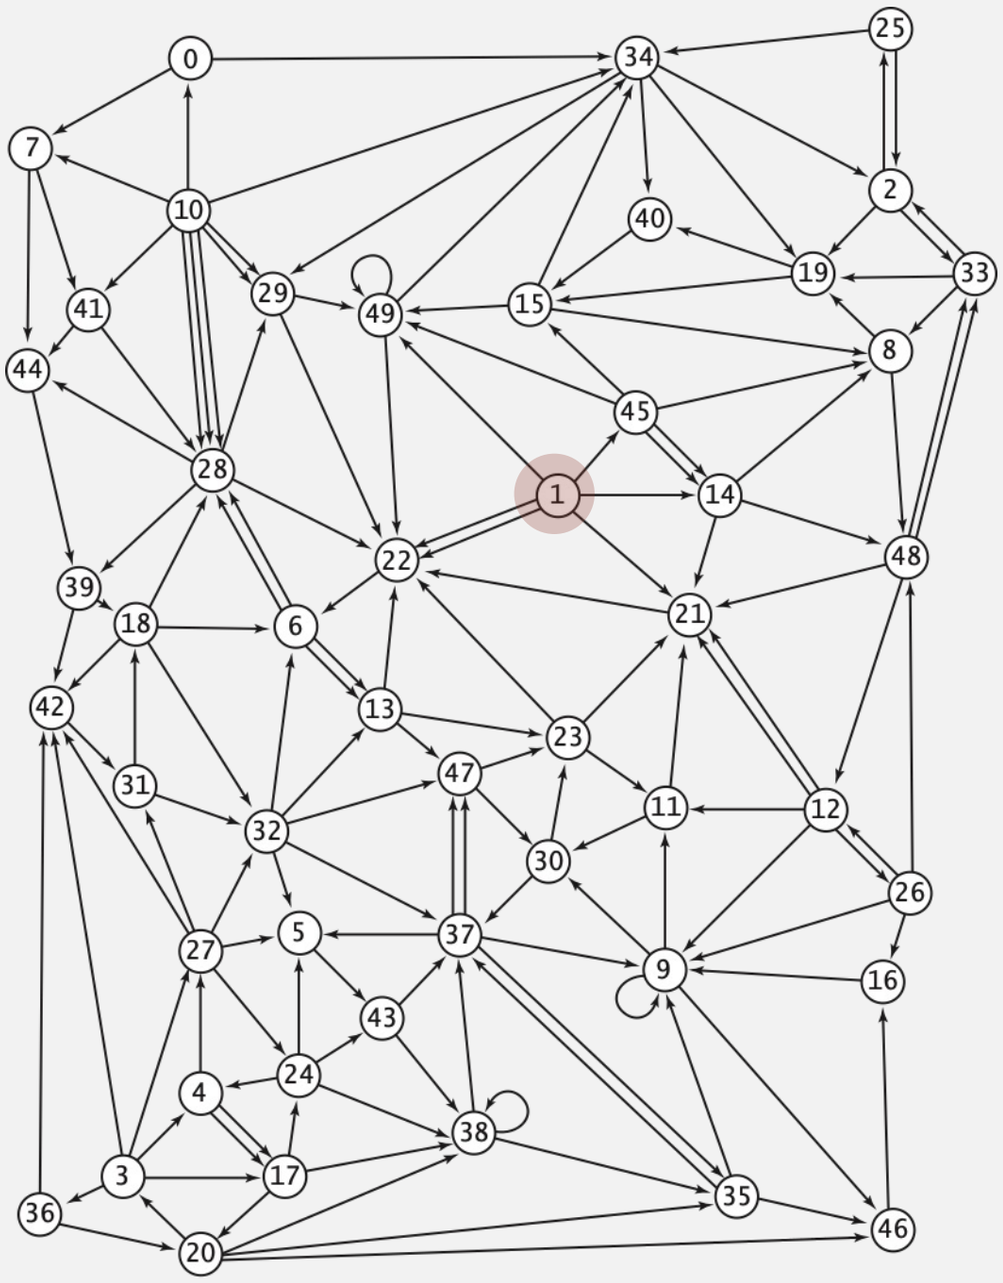
Q. How to implement multi-source shortest paths algorithm?

Breadth-first search in digraphs application: web crawler

Goal. Crawl web, starting from some root web page, say www.rutgers.edu.

Solution. [BFS with implicit digraph]

- Choose root web page as source s.
- Maintain a Queue of websites to explore.
- Maintain a SET of marked websites.
- Dequeue the next website and enqueue any unmarked websites to which it links.



Bare-bones web crawler: Java implementation

```
Queue<String> queue = new Queue<String>();
SET<String> marked = new SET<String>();

String root = "http://www.rutgers.edu";
queue.enqueue(root);
marked.add(root);
while (!queue.isEmpty()) {
   String v = queue.dequeue();
   StdOut.println(v);
   In in = new In(v);
   String input = in.readAll();

   String regexp = "http://(\\w+\\.)+(\\w+)";
   Pattern pattern = Pattern.compile(regexp);
   Matcher matcher = pattern.matcher(input);

   while (matcher.find()) {
    String w = matcher.group();
    if (!marked.contains(w)) {
       marked.add(w);
       queue.enqueue(w);
    }
   }
}
```

queue of websites to crawl

set of marked websites

start crawling from root website

read in raw html from next website in queue

use regular expression to find all URLs in website of form http://xxx.yyy.zzz

[crude pattern misses relative URLs]

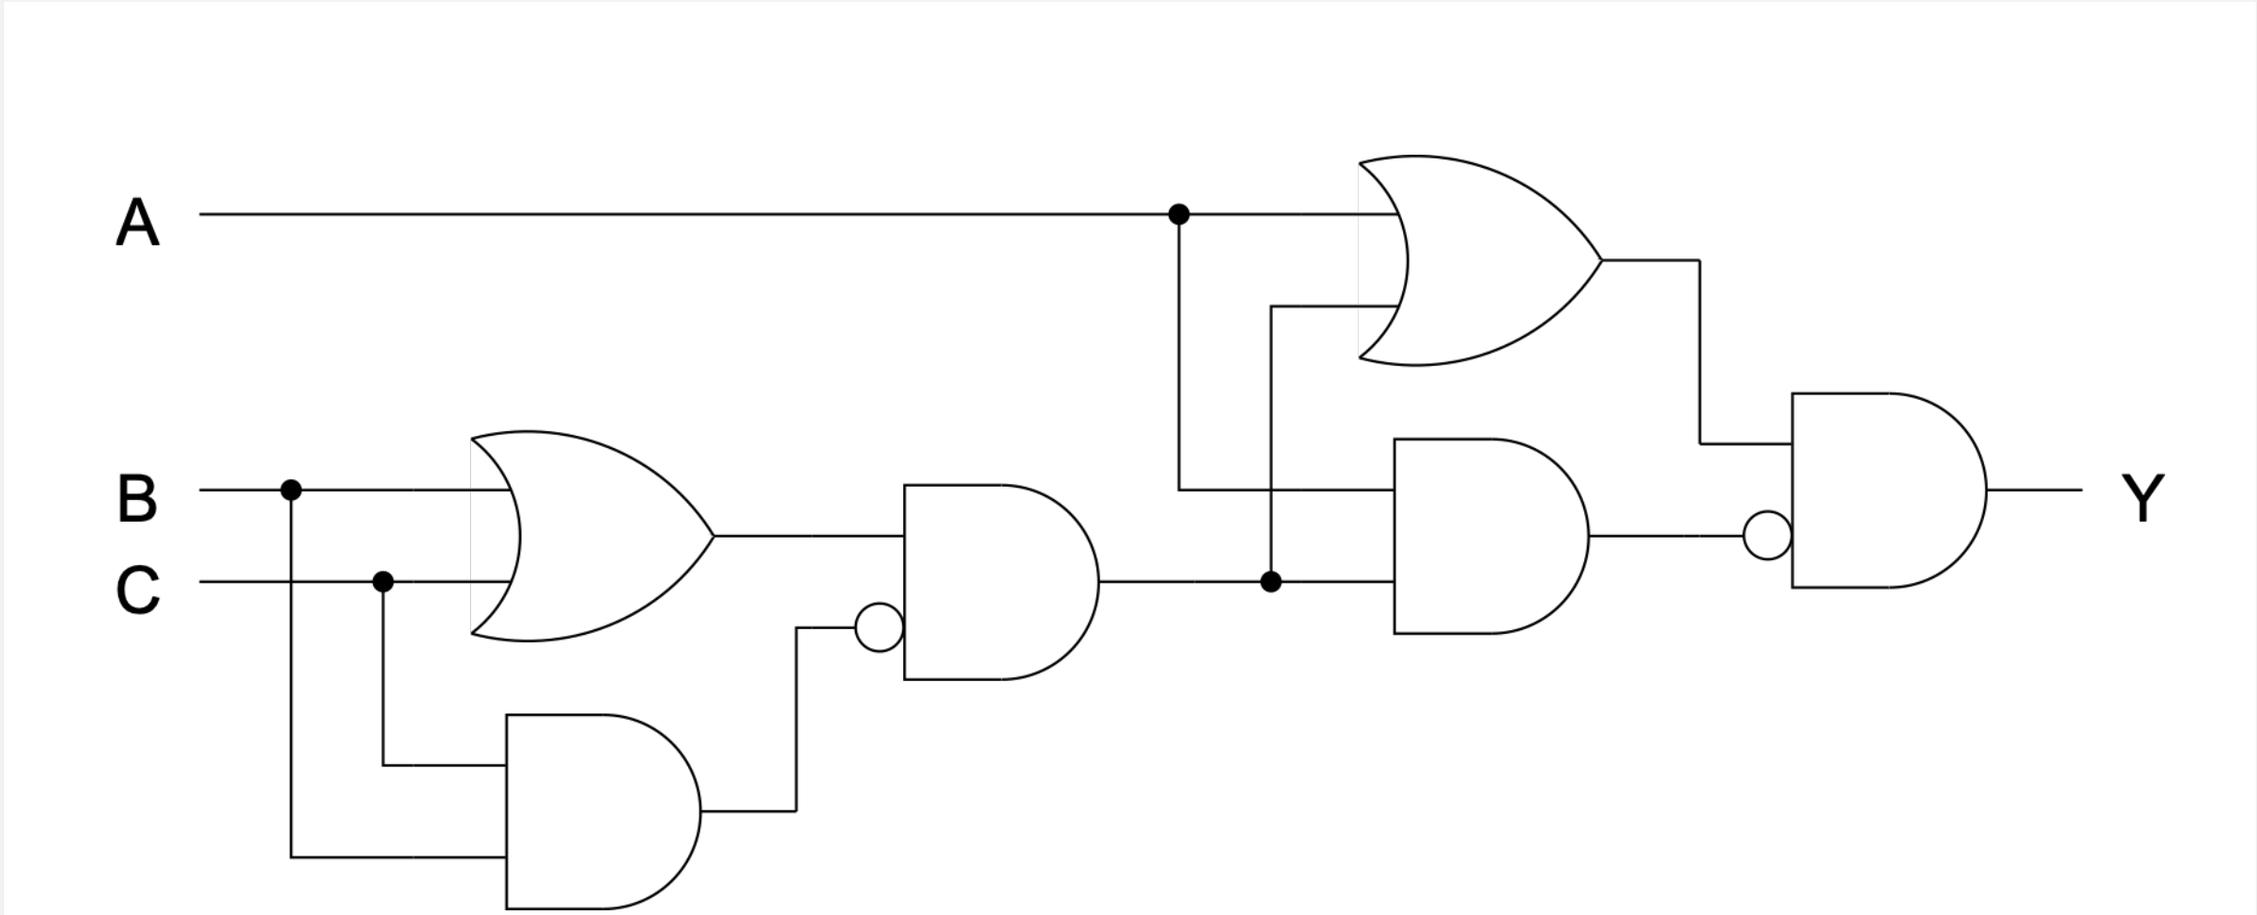
if unmarked, mark and enqueue

Directed Graphs

- *introduction*
- *digraph API*
- *depth-first search*
- *breadth-first search*
- *topological sort*

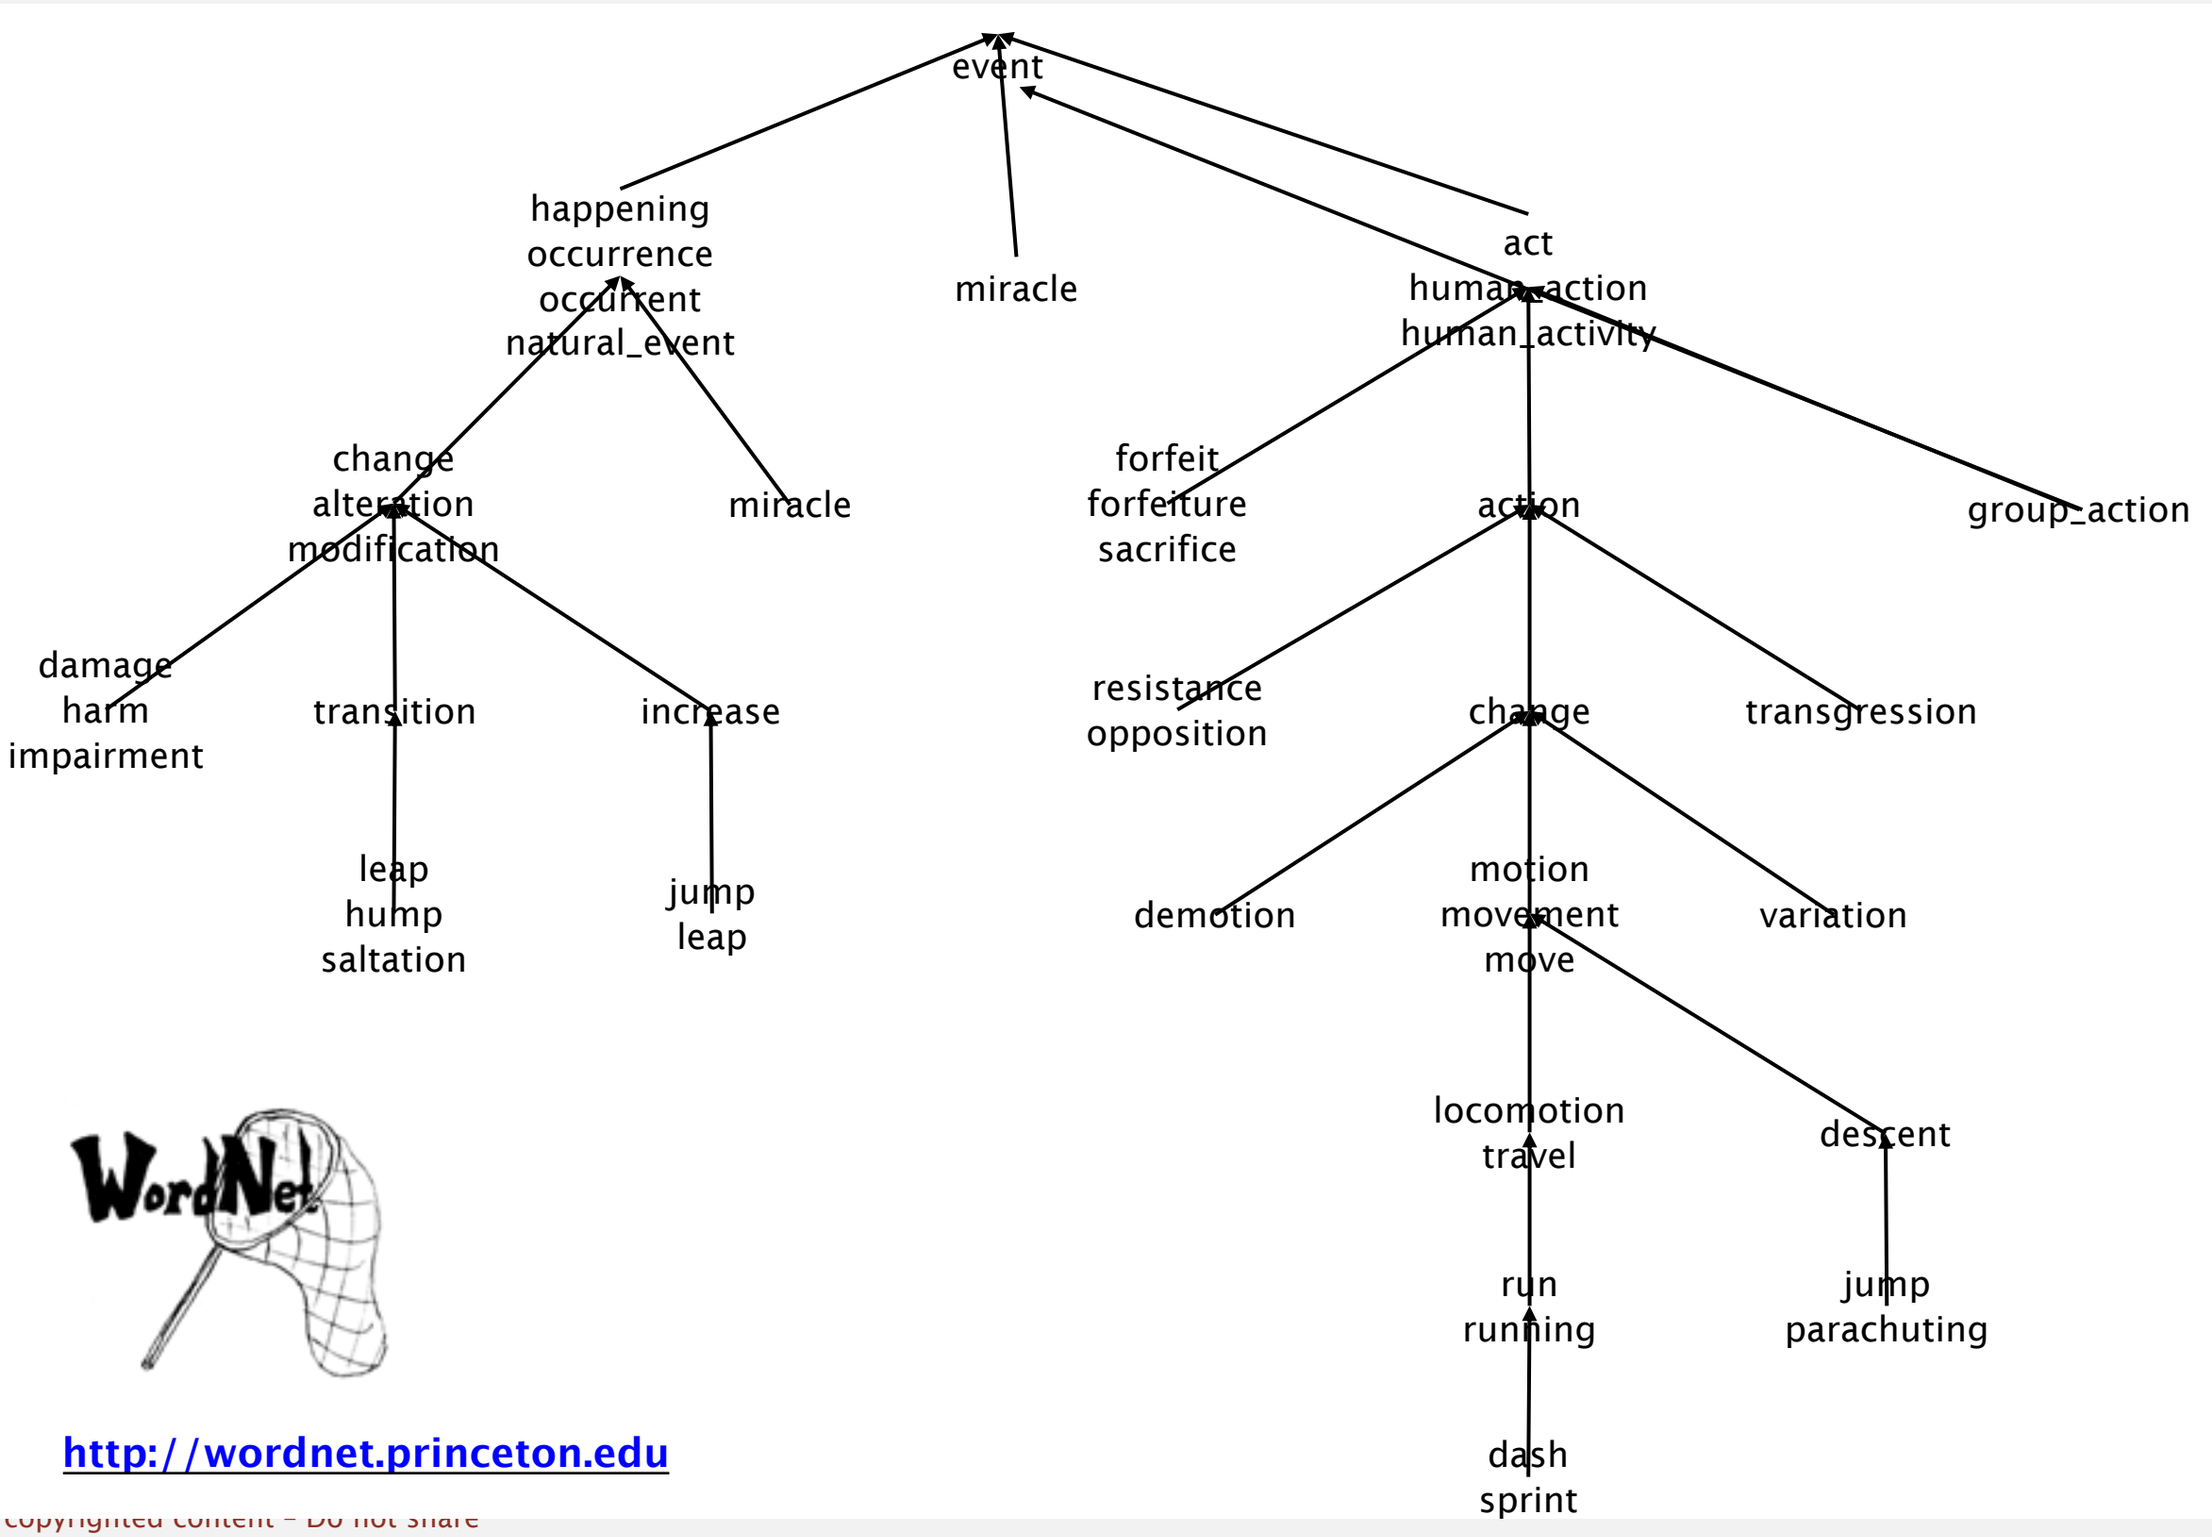
Combinational circuit (optional)

Vertex = logical gate; edge = wire.



WordNet digraph

Vertex = synset; edge = hypernym relationship.



http://wordnet.princeton.edu

Git digraph

Vertex = revision of repository; edge = revision relationship.

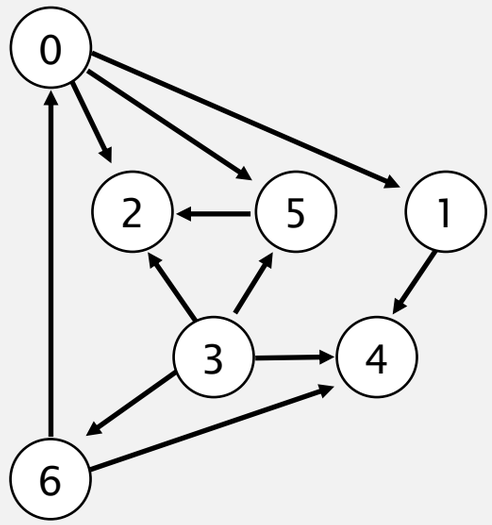
Precedence scheduling

Goal. Given a set of tasks to be completed with precedence constraints, in which order should we schedule the tasks?

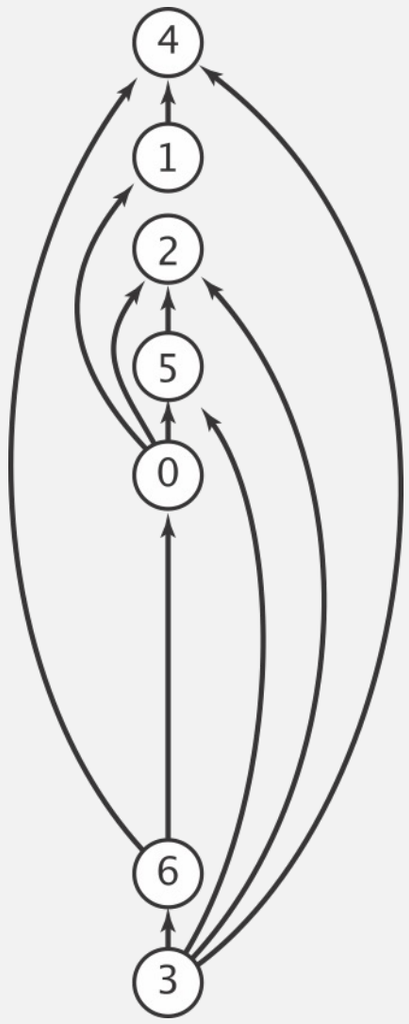
Digraph model. vertex = task; edge = precedence constraint.

0. Algorithms
1. Complexity Theory
2. Artificial Intelligence
3. Intro to CS
4. Cryptography
5. Scientific Computing
6. Advanced Programming

tasks



precedence constraint graph



feasible schedule

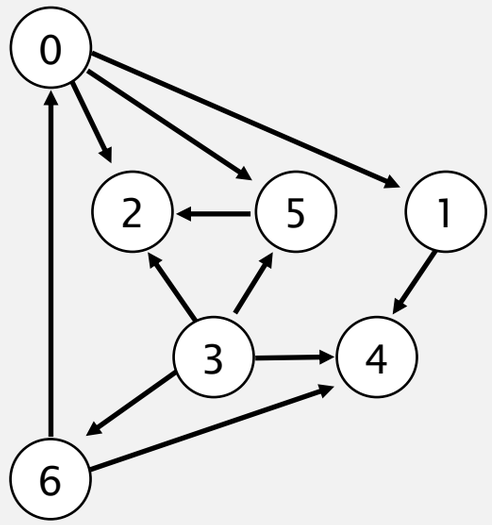
Topological sort

DAG. Directed acyclic graph.

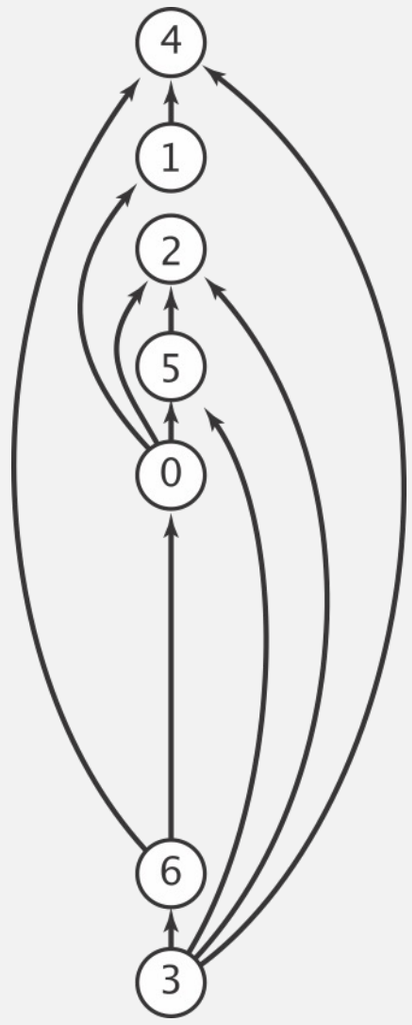
Topological sort. Redraw DAG so all edges point upwards.

0→5	0→2
0→1	3→6
3→5	3→4
5→2	6→4
6→0	3→2
1→4	

directed edges



DAG



topological order

Directed graphs: quiz 3

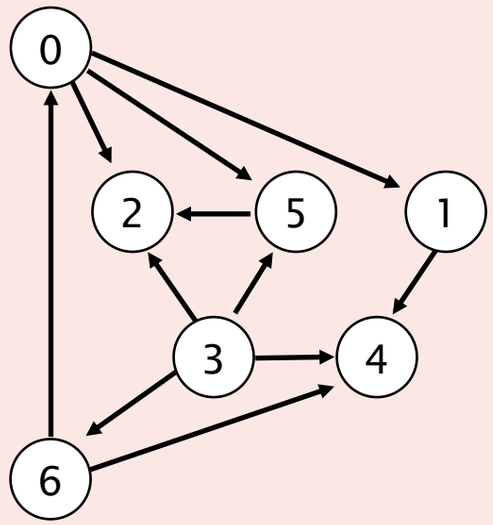
Suppose that you want to find a topological order of a DAG. Which graph search algorithm should you use?

A. depth-first search

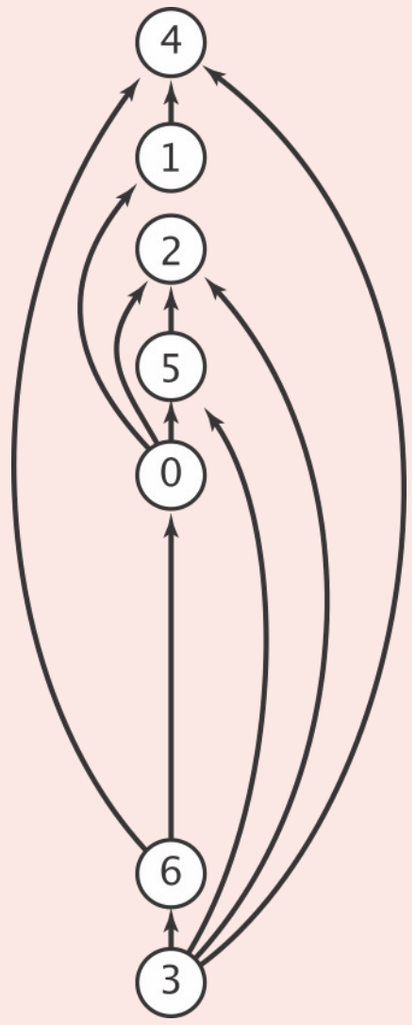
B. breadth-first search

C. either A or B

D. neither A nor B



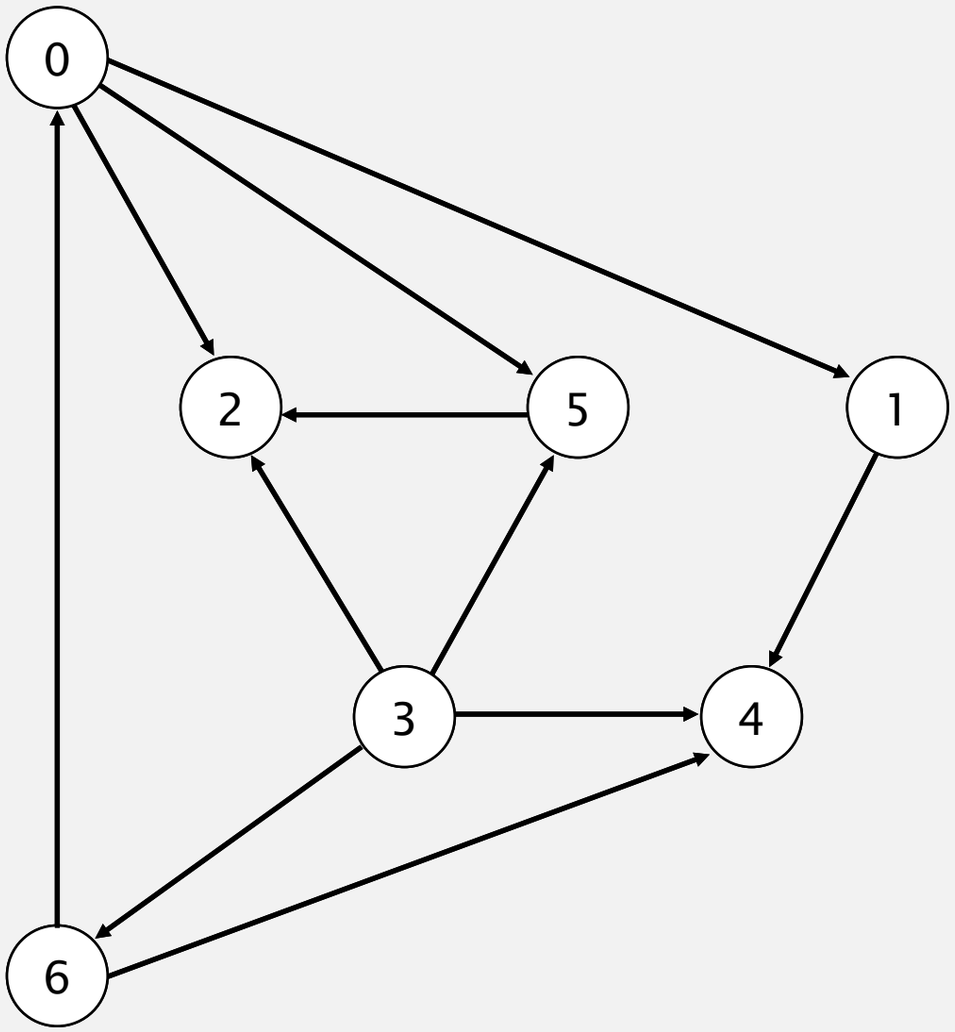
DAG



topological order

Topological sort demo

- Run depth-first search.
- Return vertices in reverse postorder.



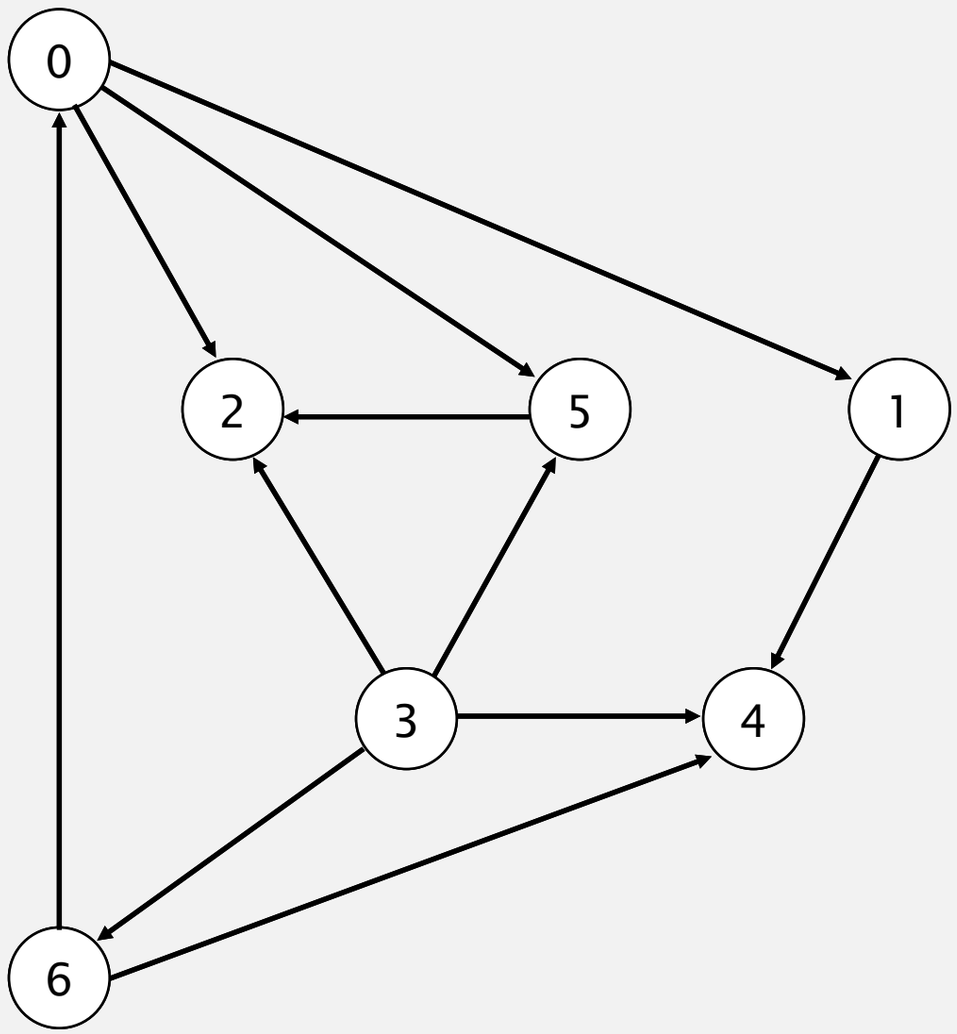
tinyDAG7.txt

```
7
11
 0  5
 0  2
 0  1
 3  6
 3  5
 3  4
 5  2
 6  4
 6  0
 3  2
```

a directed acyclic graph

Topological sort demo

- Run depth-first search.
- Return vertices in reverse postorder.



postorder

4 1 2 5 0 6 3

topological order

3 6 0 5 2 1 4

done

Depth-first search order

LO 9B.9

```
public class DepthFirstOrder
{
   private boolean[] marked;
   private Stack<Integer> reversePostorder;
   public DepthFirstOrder(Digraph G)
   {
      reversePostorder = new Stack<Integer>();
      marked = new boolean[G.V()];
      for (int v = 0; v < G.V(); v++)
         if (!marked[v]) dfs(G, v);
   }

   private void dfs(Digraph G, int v)
   {
      marked[v] = true;
      for (int w : G.adj(v))
         if (!marked[w]) dfs(G, w);
      reversePostorder.push(v);
   }

   public Iterable<Integer> reversePostorder()
   {  return reversePostorder;  }

}
```

Three **vertex orderings** are of interest in typical applications:

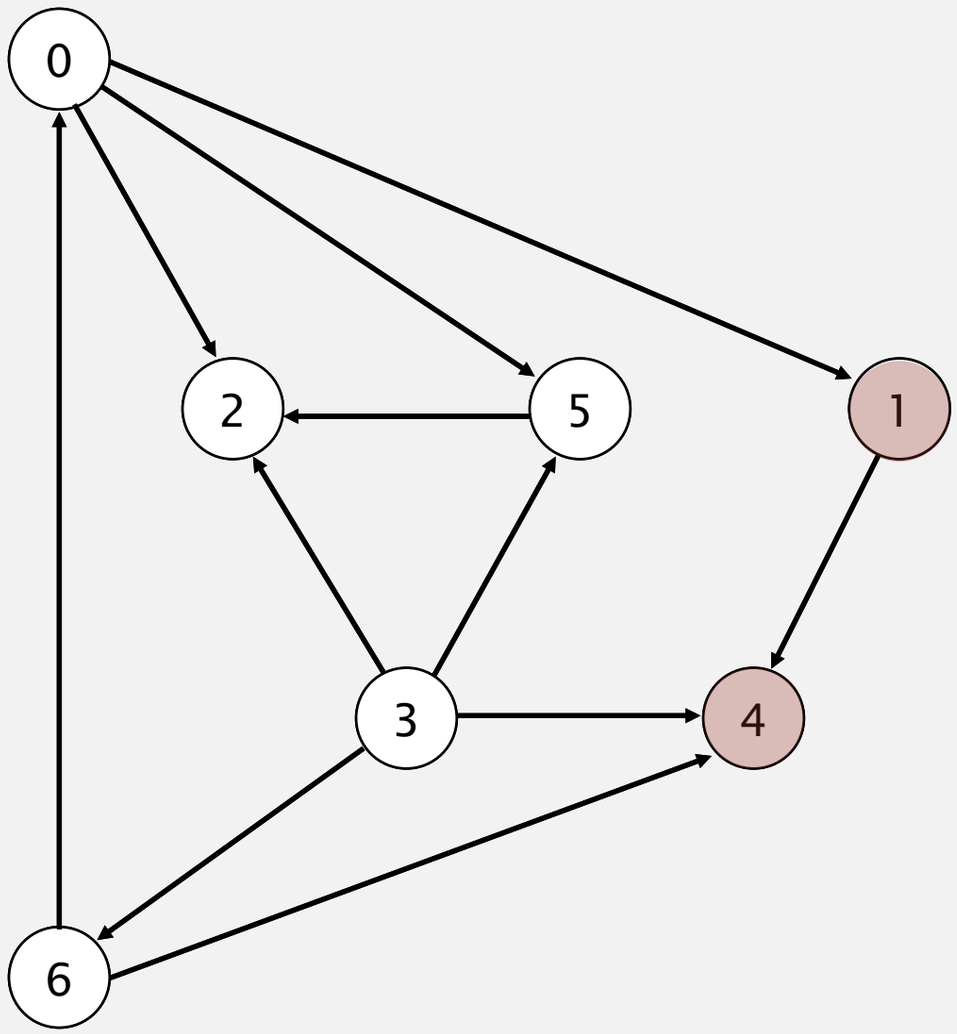
- *Preorder*: put the vertex on a queue before the recursive calls.
- *Postorder*: put the vertex on a queue after the recursive calls.
- ***Reverse postorder***: put the vertex on a stack after the recursive calls.

returns all vertices in "reverse DFS postorder"

Topological sort in a DAG: intuition

Why does topological sort algorithm work?

- First vertex in postorder has outdegree 0.
- Second-to-last vertex in postorder can only point to last vertex.
- ...



postorder

4 1 2 5 0 6 3

topological order

3 6 0 5 2 1 4

Topological sort in a DAG: correctness proof

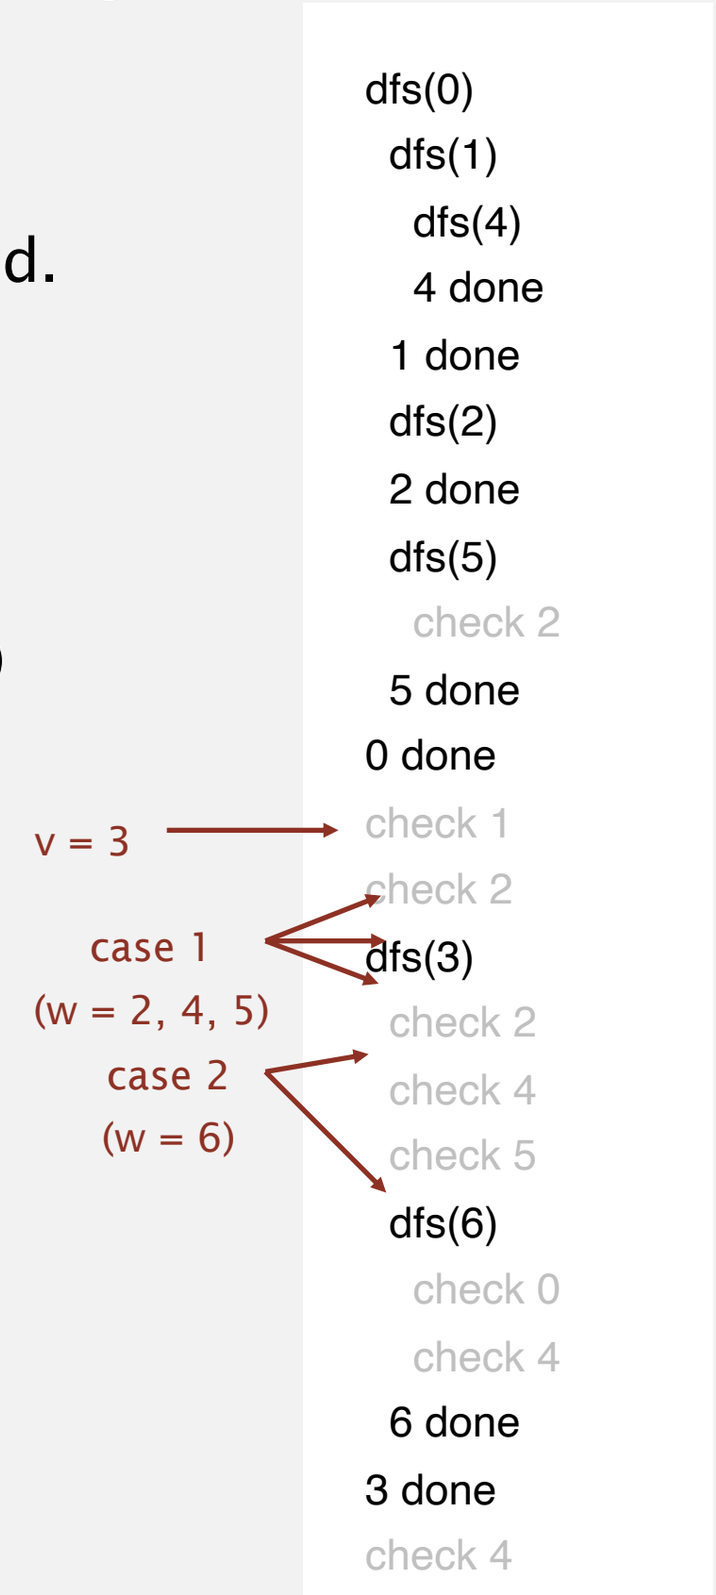
Proposition. Reverse DFS postorder of a DAG is a topological order.

Pf. Consider any edge v→w. When dfs(v) is called:

- Case 1: dfs(w) has already been called and returned.
  - thus, w appears before v in postorder

- Case 2: dfs(w) has not yet been called.
  - dfs(w) will get called directly or indirectly by dfs(v)
  - so, dfs(w) will return before dfs(v)
  - thus, w appears before v in postorder

- Case 3: dfs(w) has already been called, but has not yet returned.
  - function-call stack contains path from w to v
  - edge v→w would complete a directed cycle
  - contradiction (it's a DAG)

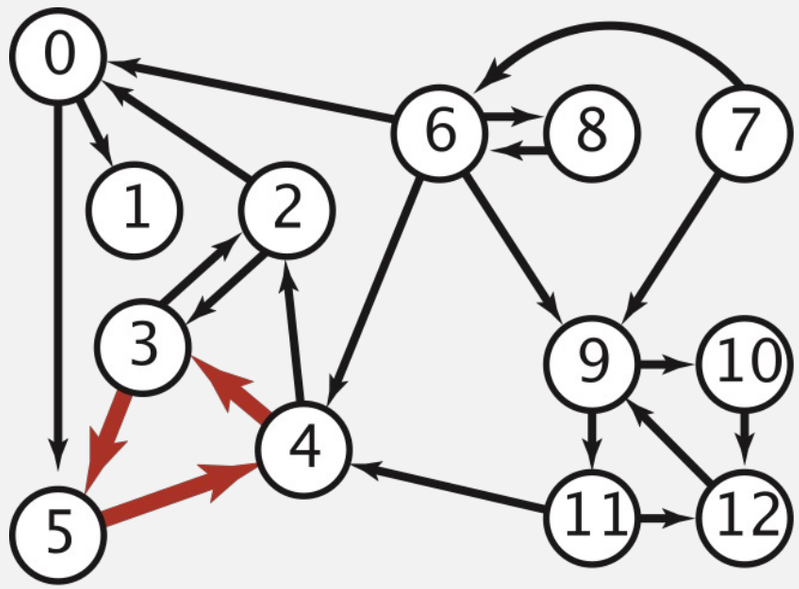


Directed cycle detection

Proposition. A digraph has a topological order iff no directed cycle.

Pf.

- If directed cycle, topological order impossible.
- If no directed cycle, DFS-based algorithm finds a topological order.



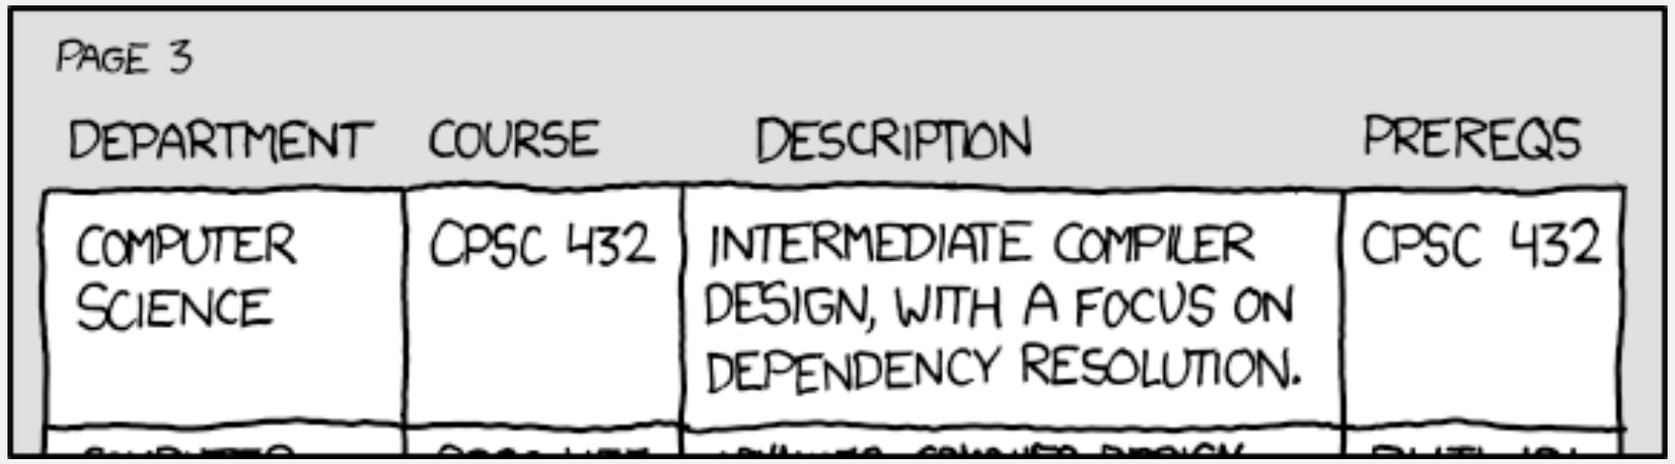
a digraph with a directed cycle

Goal. Given a digraph, find a directed cycle.

Solution. DFS. What else? See textbook.

Directed cycle detection application: precedence scheduling

Scheduling. Given a set of tasks to be completed with precedence constraints, in what order should we schedule the tasks?



http://xkcd.com/754

Remark. A directed cycle implies scheduling problem is infeasible.

Directed cycle detection application: cyclic inheritance

The Java compiler does cycle detection.

```
public class A extends B
{
   ...
}
```

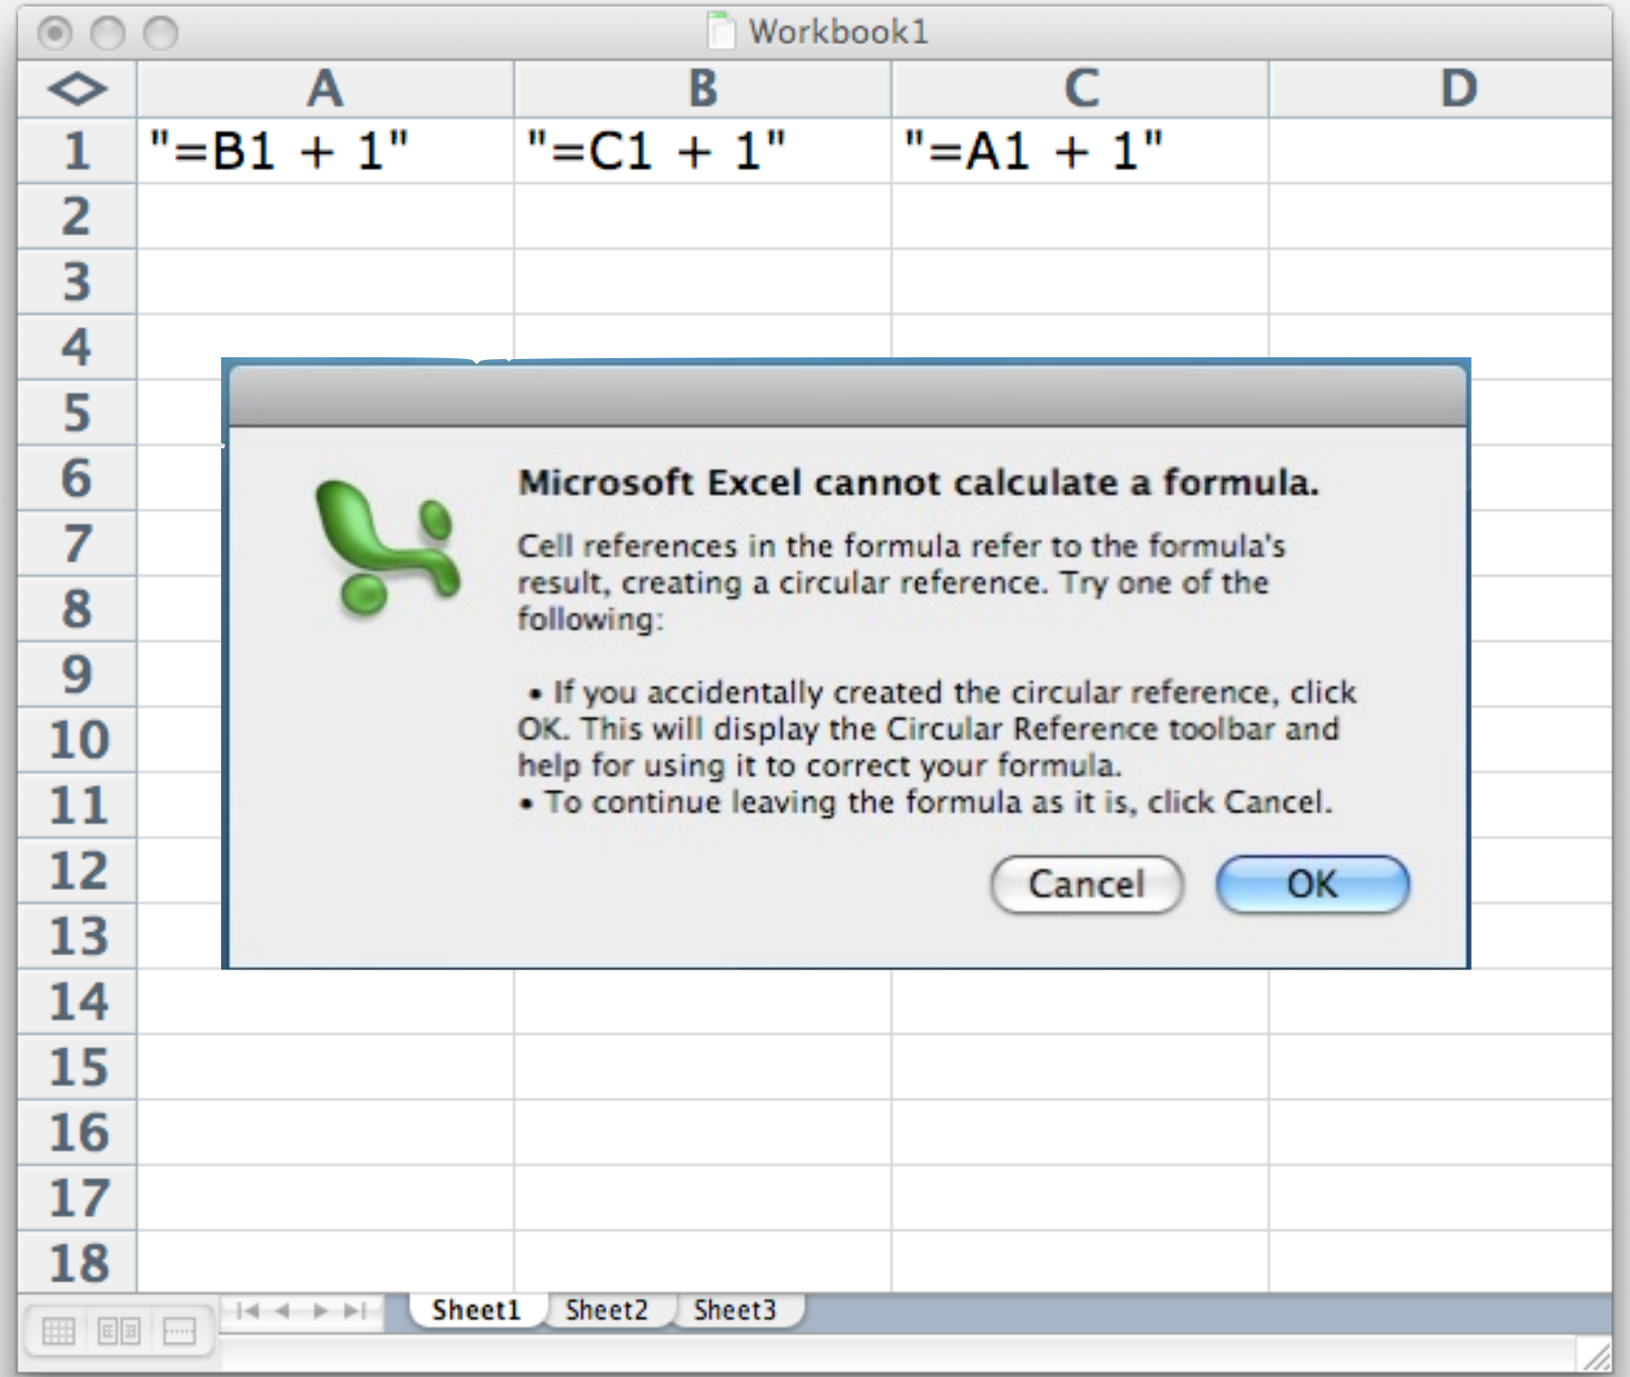
```
public class B extends C
{
   ...
}
```

```
public class C extends A
{
   ...
}
```

```
% javac A.java
A.java:1: cyclic inheritance involving A
public class A extends B { }
       ^
1 error
```

Directed cycle detection application: spreadsheet recalculation

Microsoft Excel does cycle detection.



Digraph-processing summary: algorithms of the day

single-source reachability in a digraph		DFS/BFS
shortest path in a digraph		BFS
topological sort in a DAG		DFS
