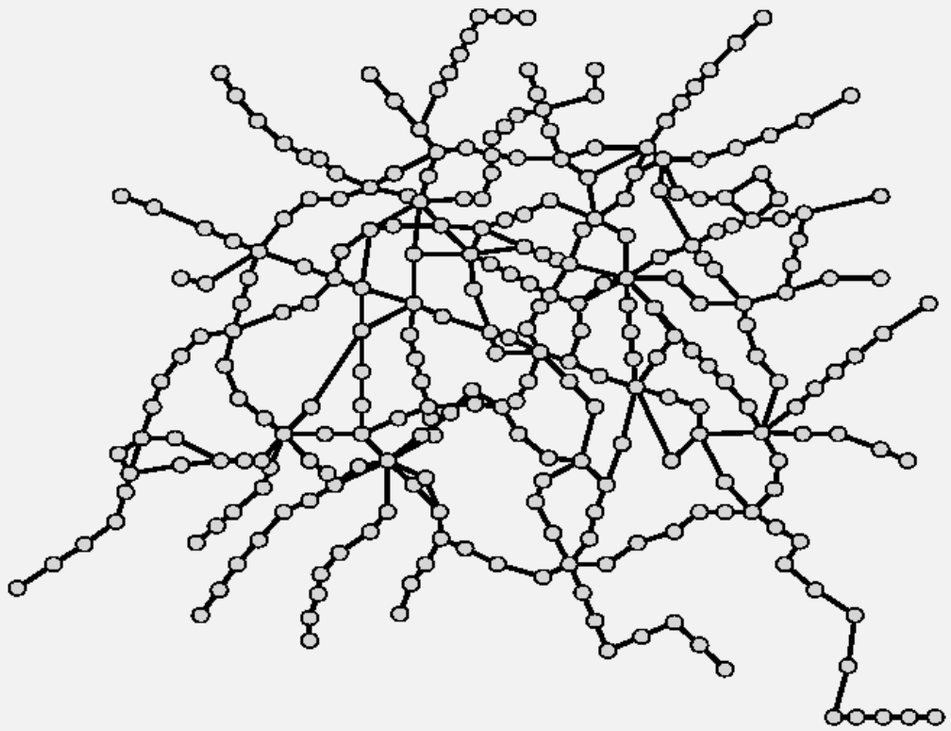
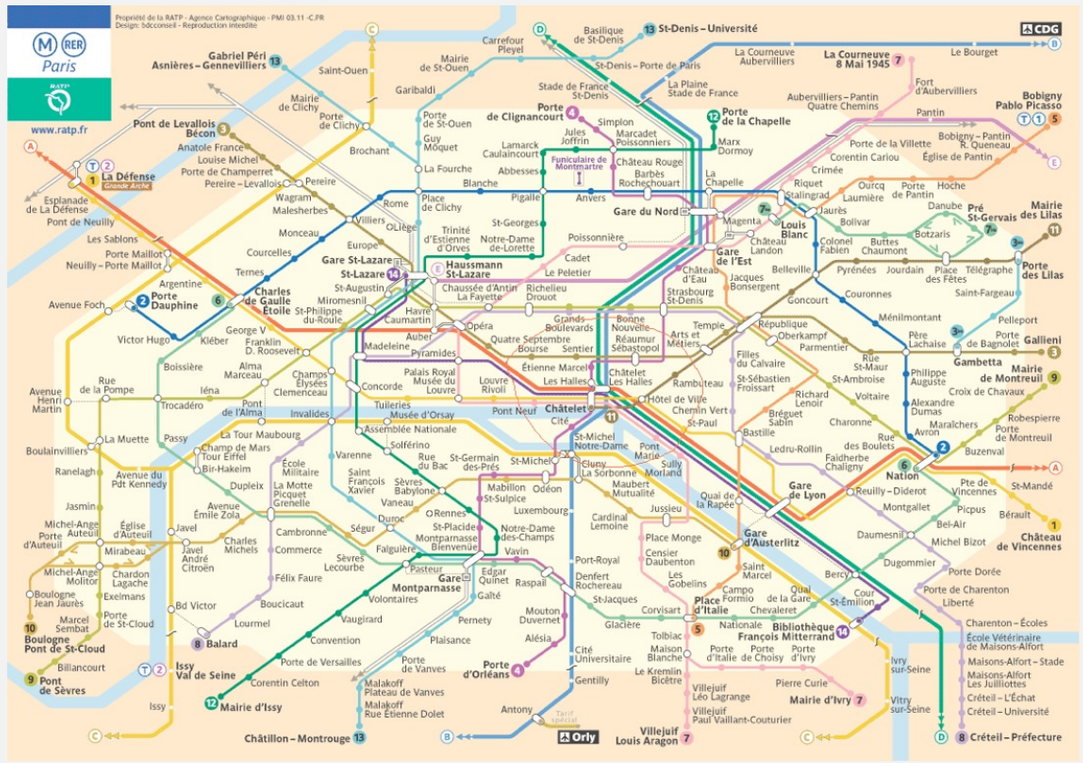
Undirected graphs

Graph. Set of vertices connected pairwise by edges.

Why study graph algorithms?

- Thousands of practical applications.
- Hundreds of graph algorithms known.
- Interesting and broadly useful abstraction.
- Challenging branch of computer science and discrete math.





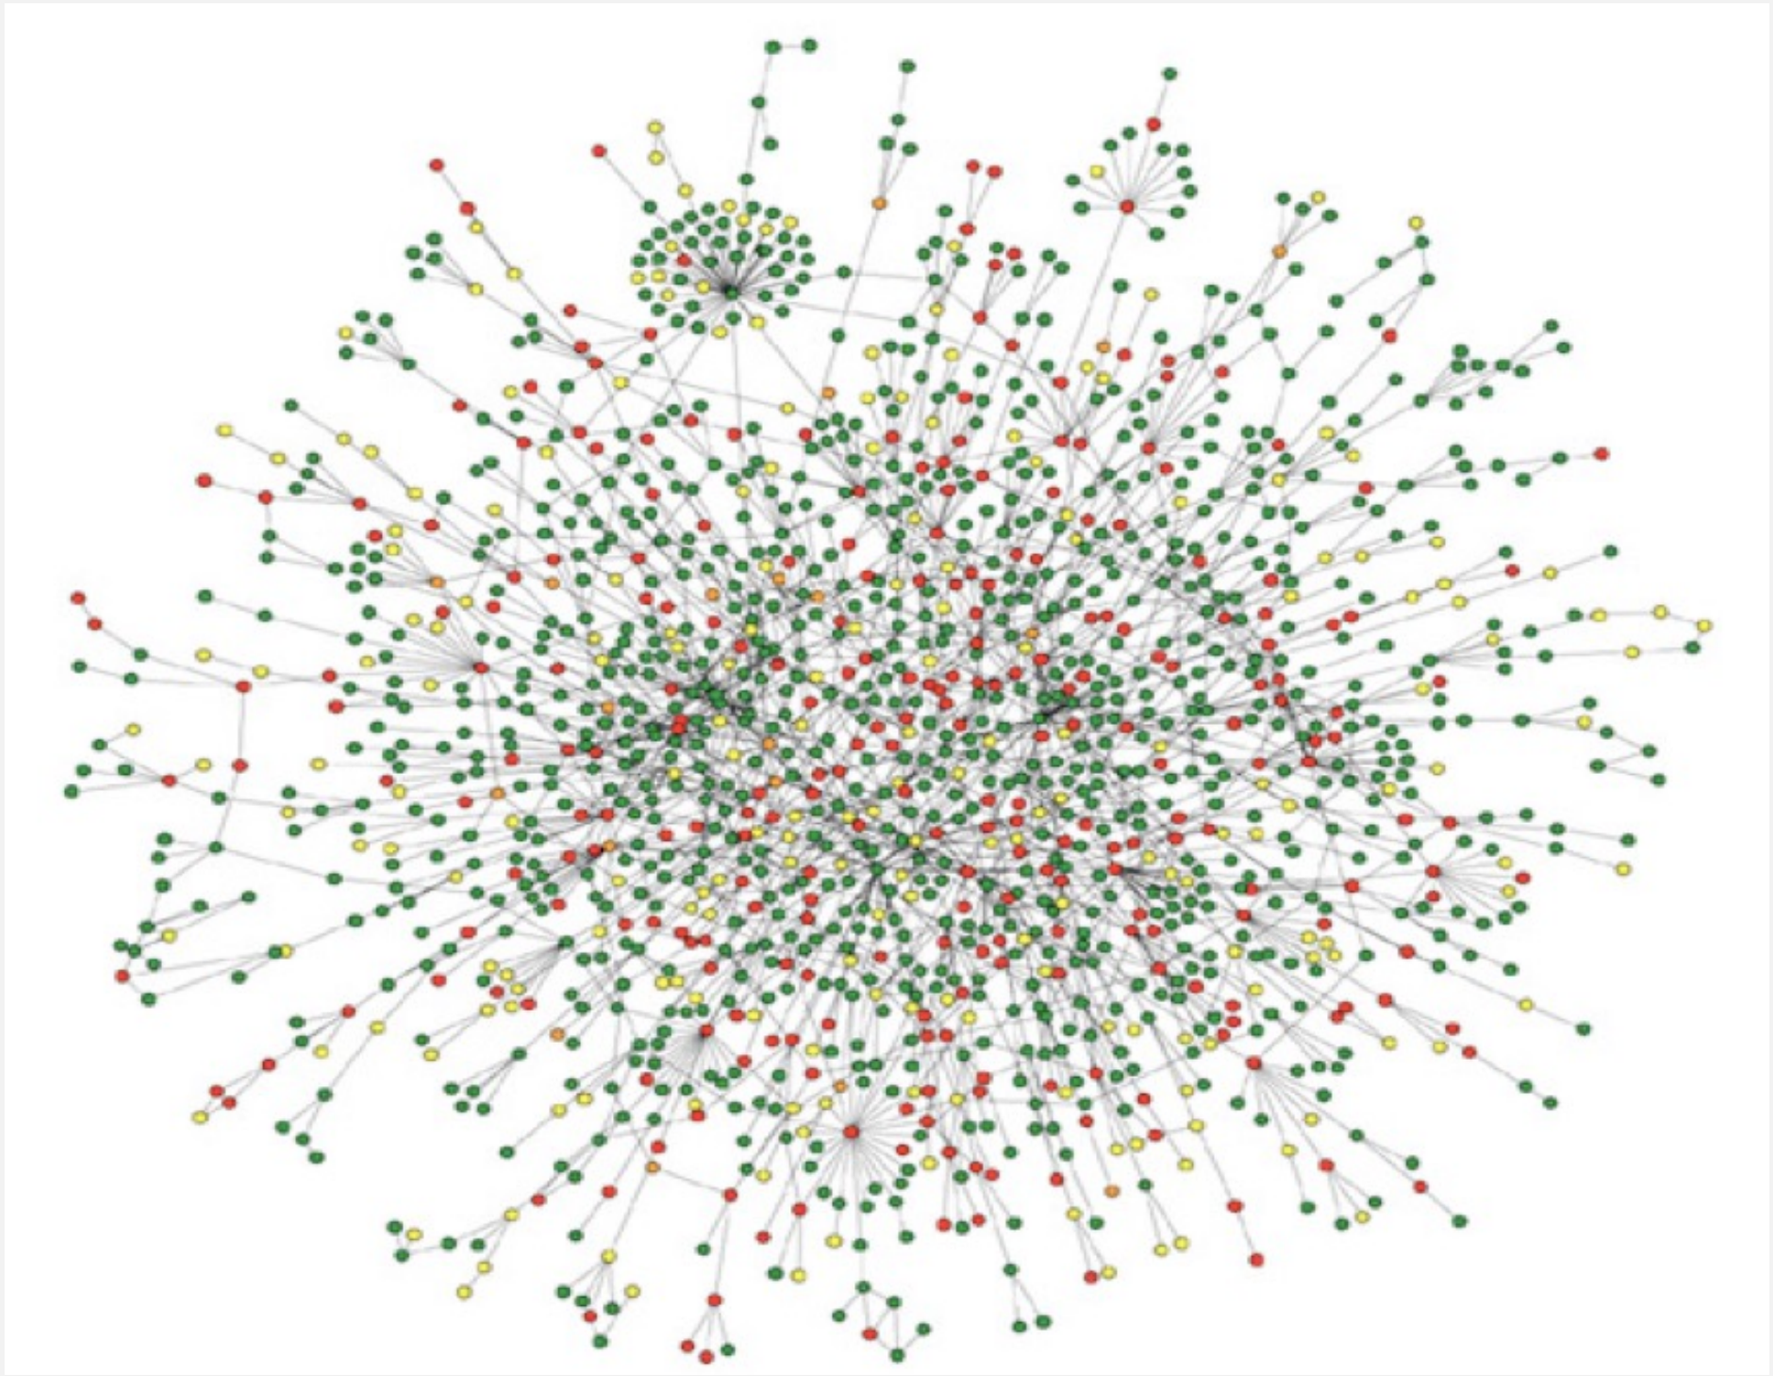
Social networks

Vertex = person; edge = social relationship.

“Visualizing Friendships” by Paul Butler

Protein-protein interaction network

Vertex = protein; edge = interaction.

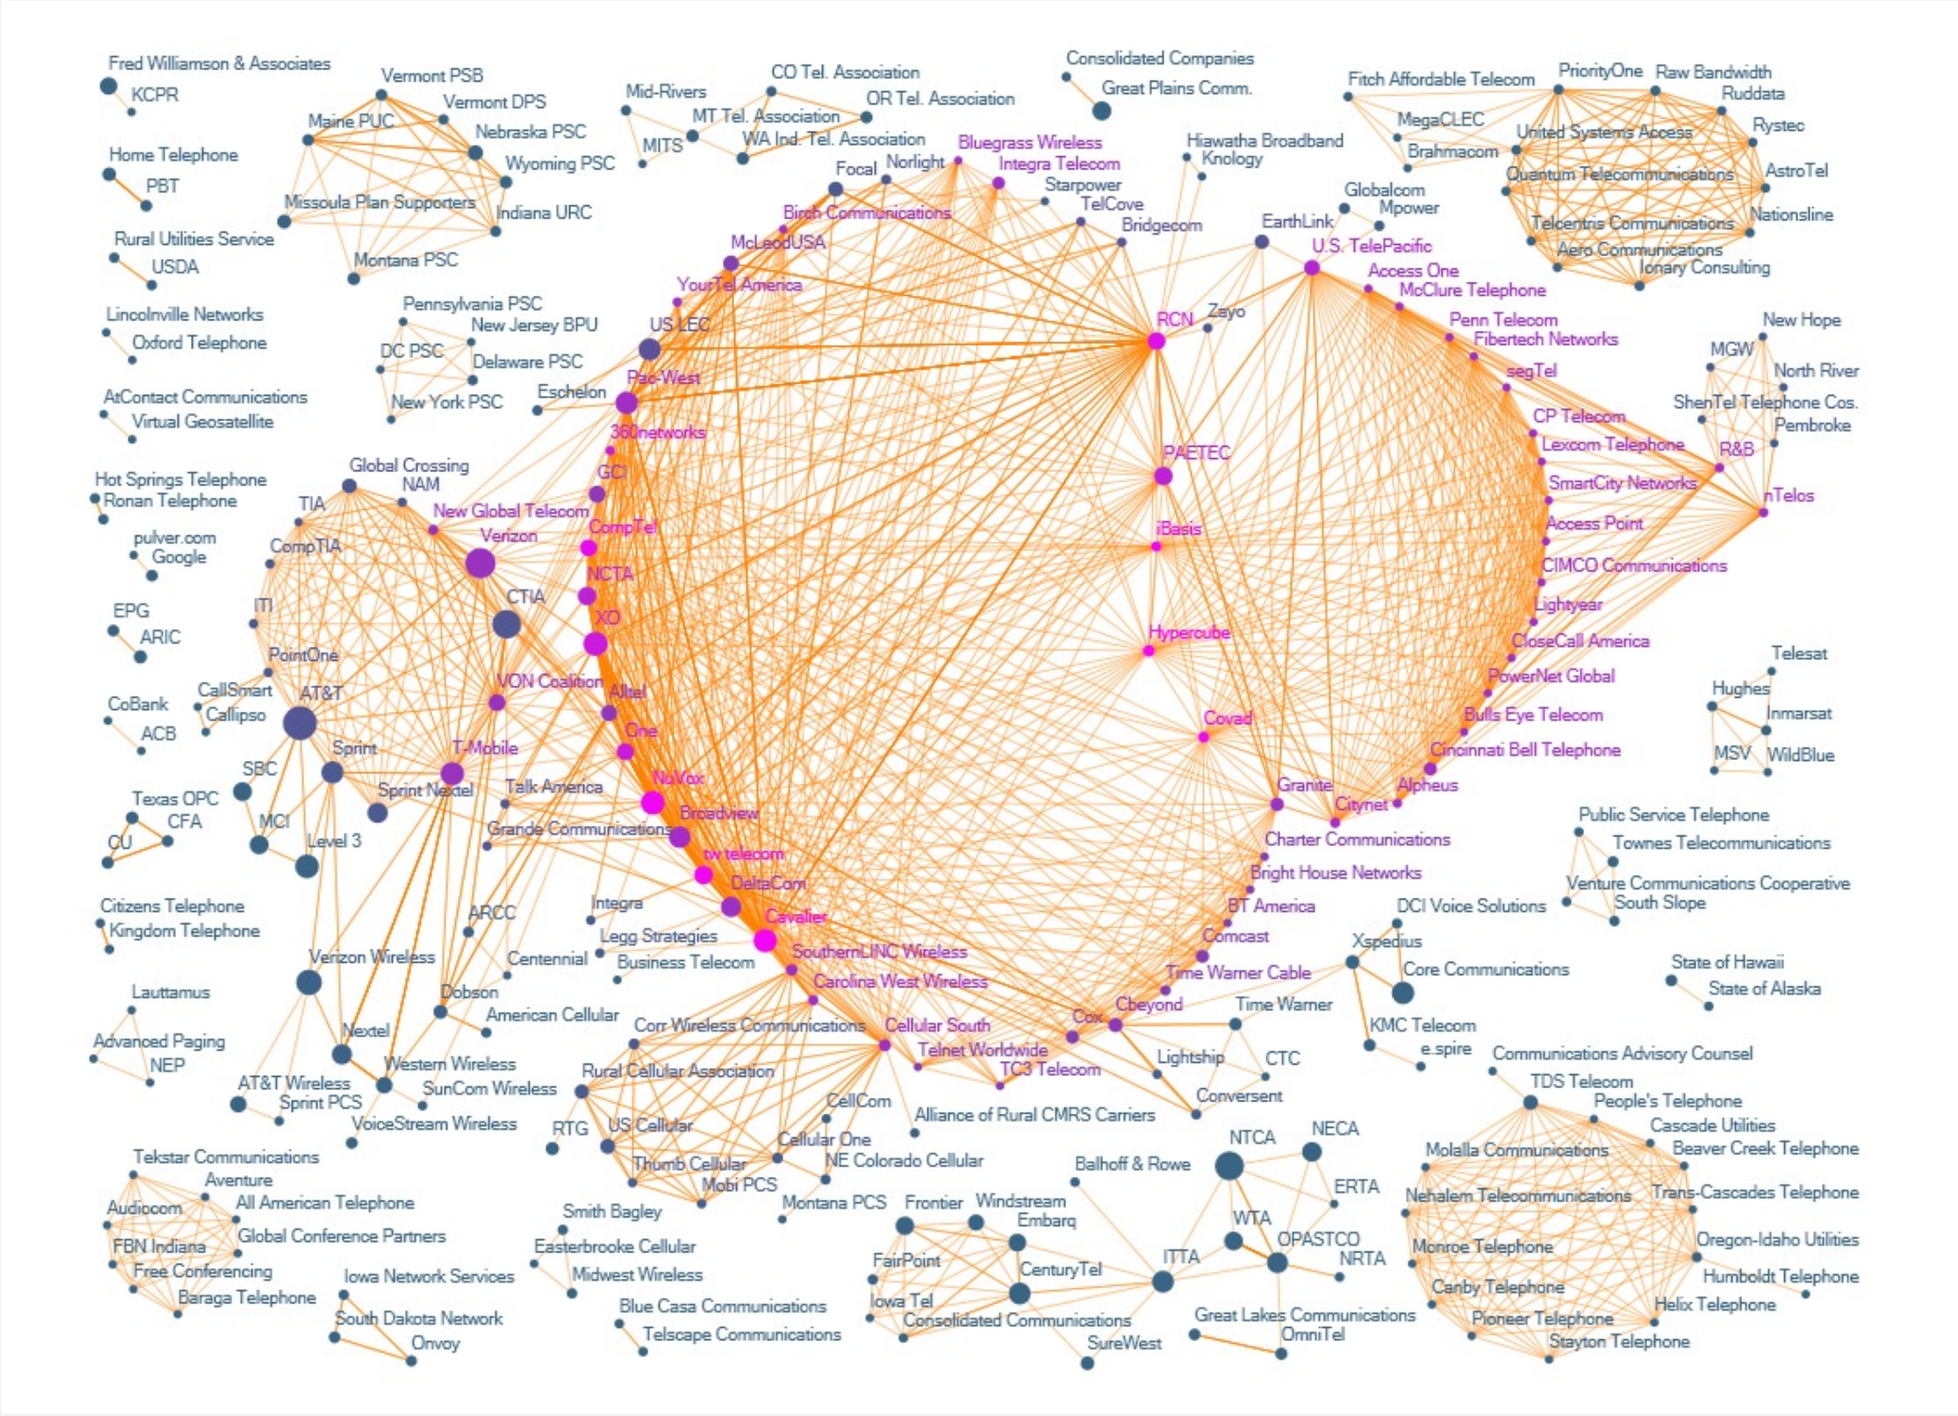


Reference: Jeong et al, Nature Review | Genetics

The evolution of FCC lobbying coalitions

LO 9A.1, 9A.3

Vertex = company; edge = lobbying partner.

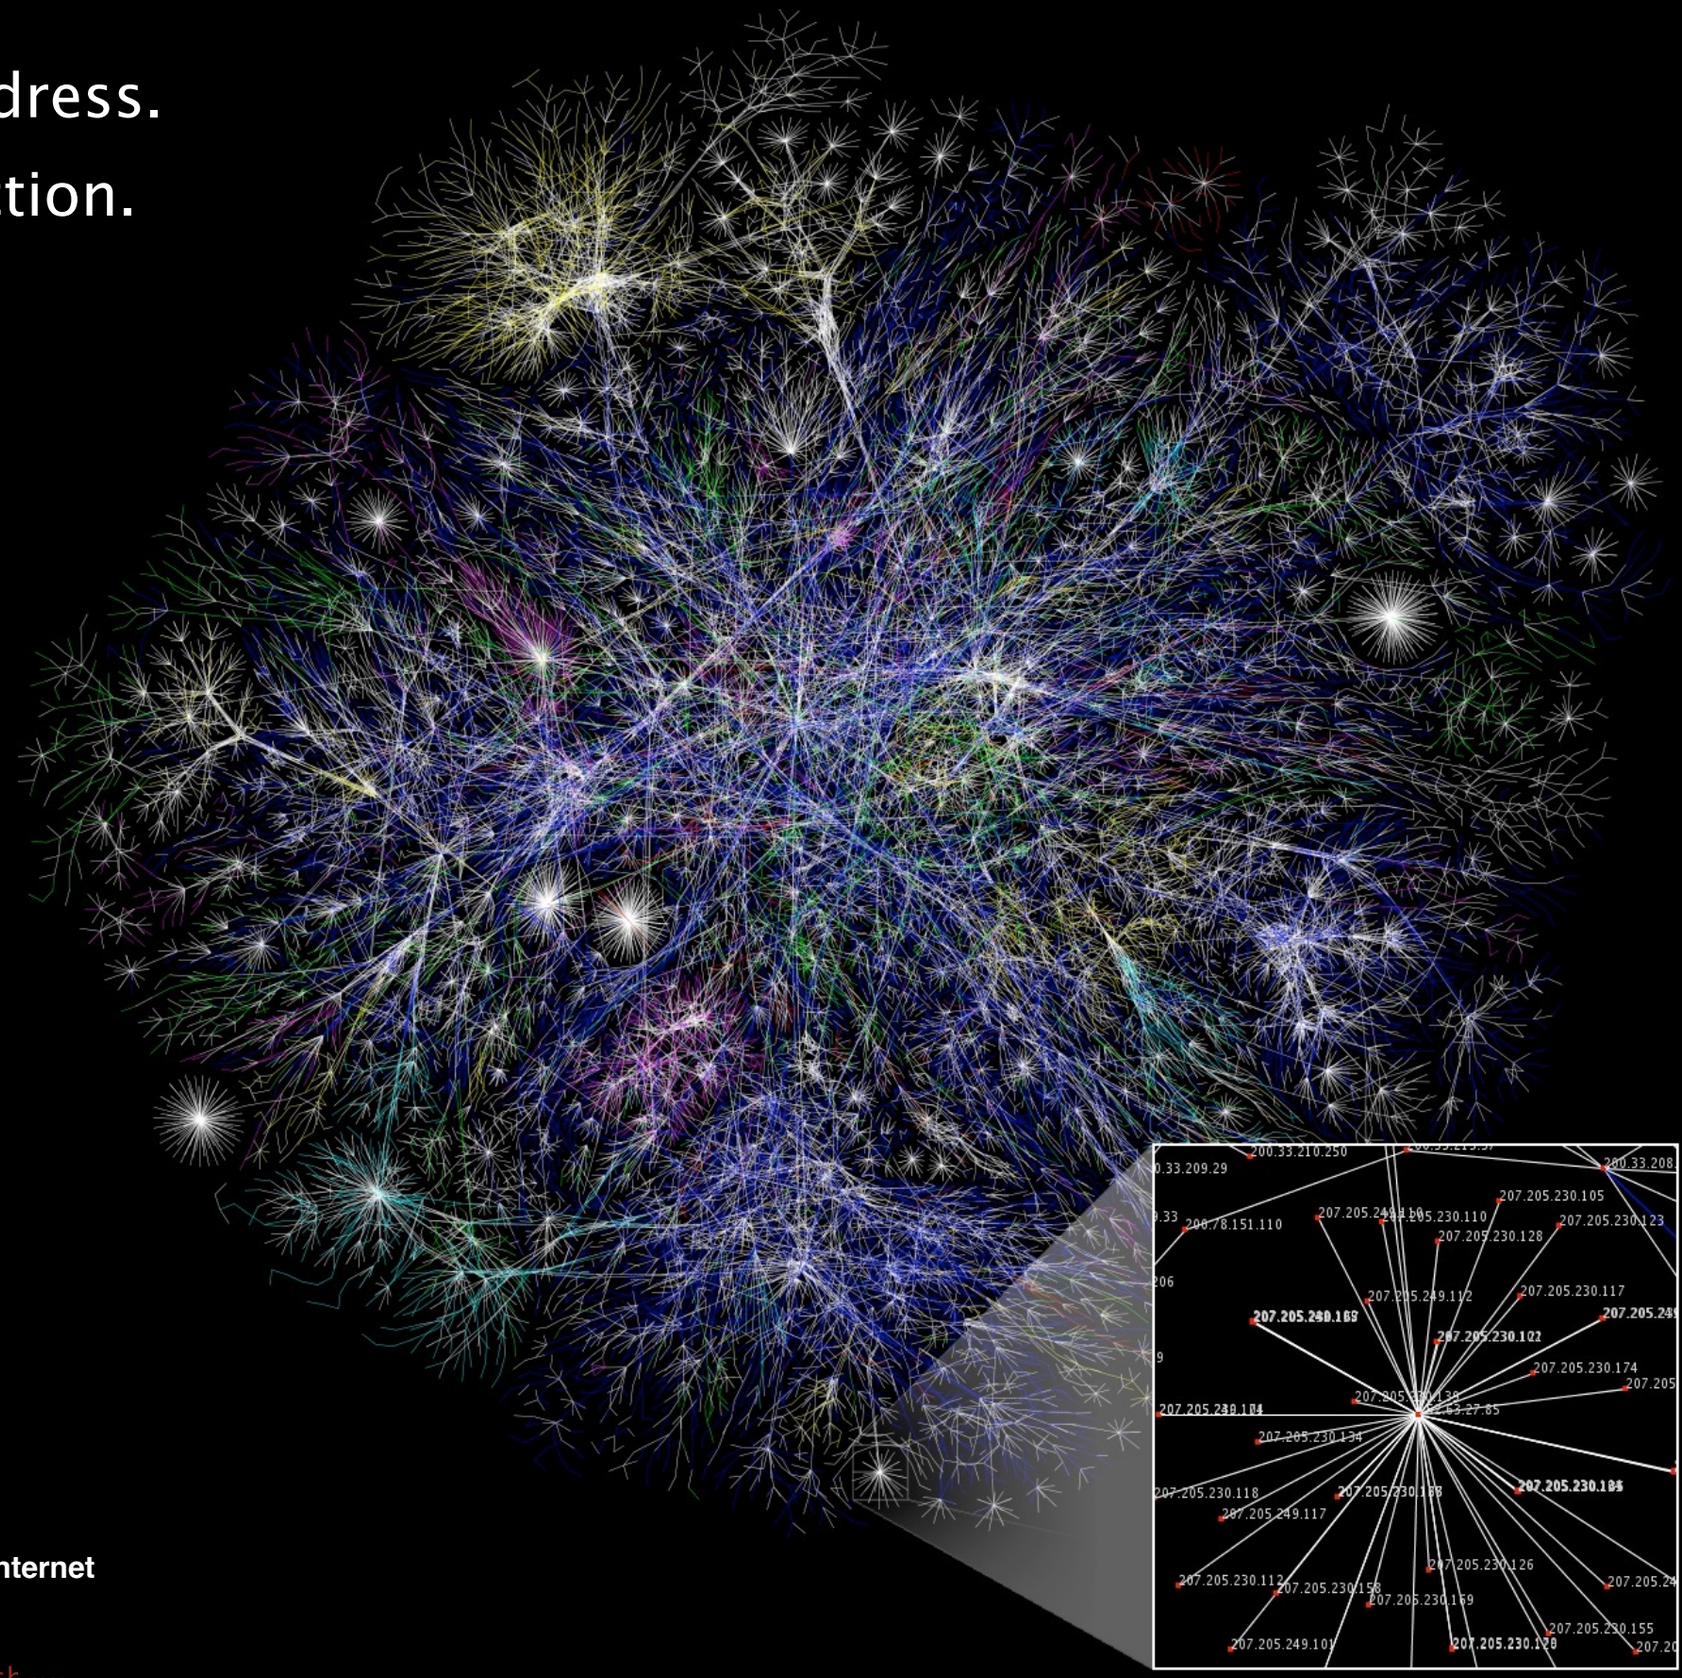


"The Evolution of FCC Lobbying Coalitions" by Pierre de Vries in JoSS Visualization Symposium 2010

The Internet as mapped by the Opte Project

Vertex = IP address.

Edge = connection.



http://en.wikipedia.org/wiki/Internet

Graph applications

LO 9A.3

graph	vertex	edge
communication	telephone, computer	fiber optic cable
circuit	gate, register, processor	wire
mechanical	joint	rod, beam, spring
financial	stock, currency	transactions
transportation	intersection	street
internet	class C network	connection
game	board position	legal move
social relationship	person	friendship
neural network	neuron	synapse
protein network	protein	protein–protein interaction
molecule	atom	bond

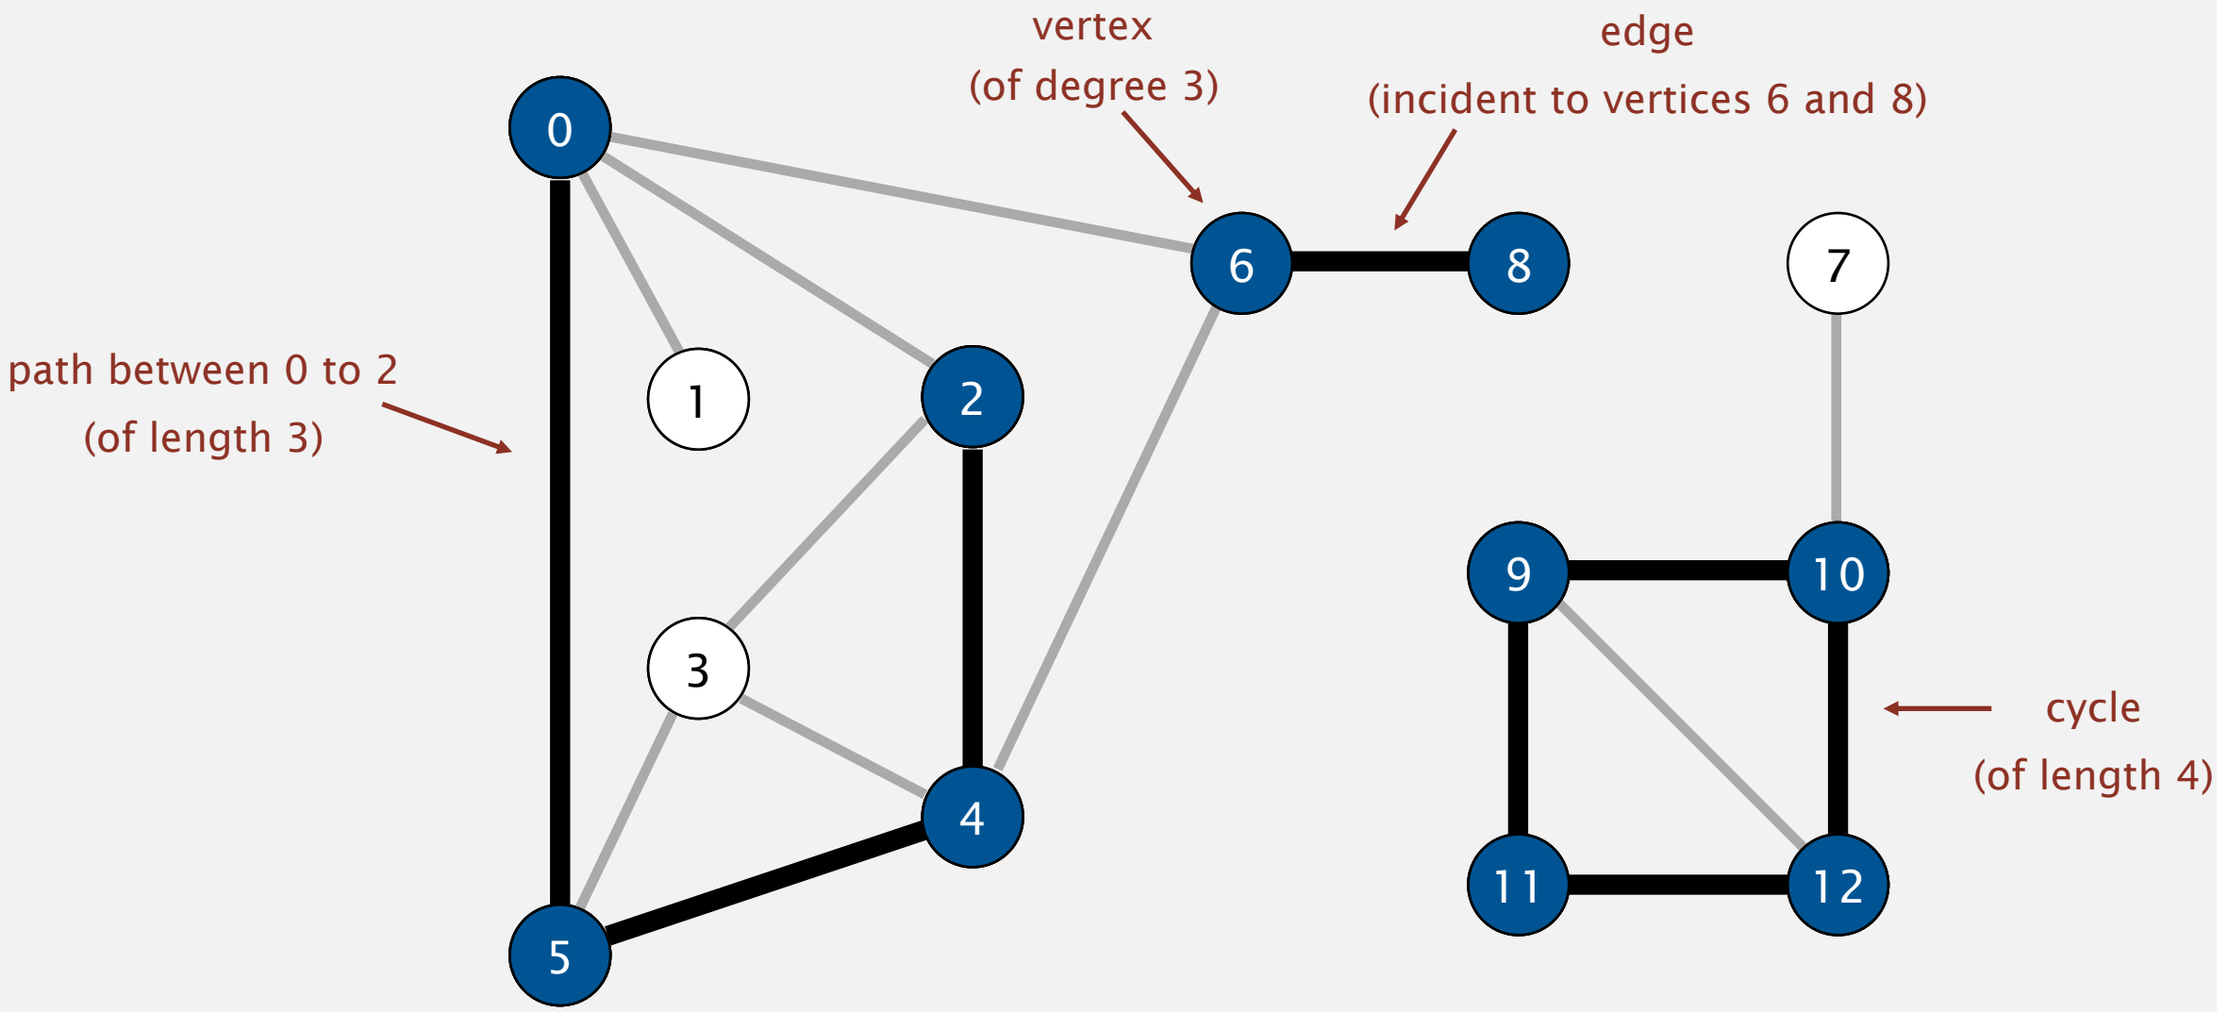
Graph terminology

Graph. Set of vertices connected pairwise by edges.

Path. Sequence of vertices connected by edges.

Def. Two vertices are connected if there is a path between them.

Cycle. Path whose first and last vertices are the same.



Some graph-processing problems

problem	description
s-t path	*Is there a path between s and t ?*
shortest s-t path	*What is the shortest path between s and t ?*
cycle	*Is there a cycle in the graph ?*
Euler cycle	*Is there a cycle that uses each edge exactly once ?*
Hamilton cycle	*Is there a cycle that uses each vertex exactly once ?*
connectivity	*Is there a path between every pair of vertices ?*
biconnectivity	*Is there a vertex whose removal disconnects the graph ?*
planarity	*Can the graph be drawn in the plane with no crossing edges ?*
graph isomorphism	*Are two graphs isomorphic?*

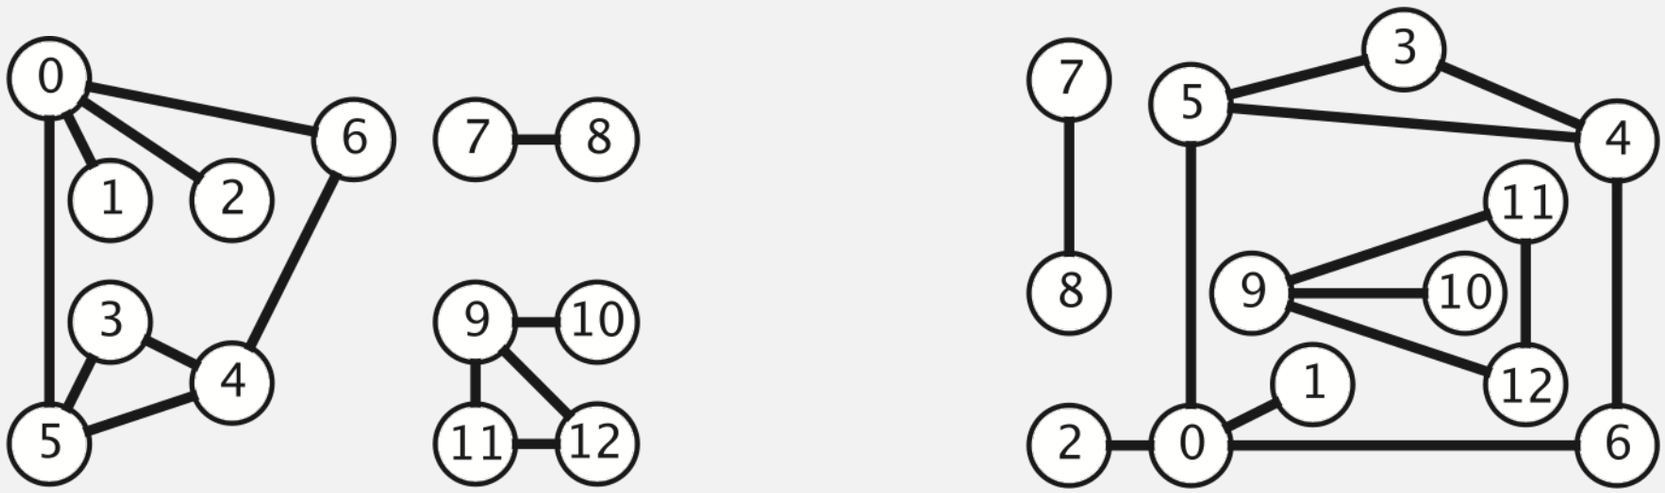
Challenge. Which graph problems are easy? difficult? intractable?

UNDIRECTED GRAPHS

- *introduction*
- *graph API*
- *depth-first search*
- *breadth-first search*
- *challenges*

Graph representation

Graph drawing. Provides intuition about the structure of the graph.



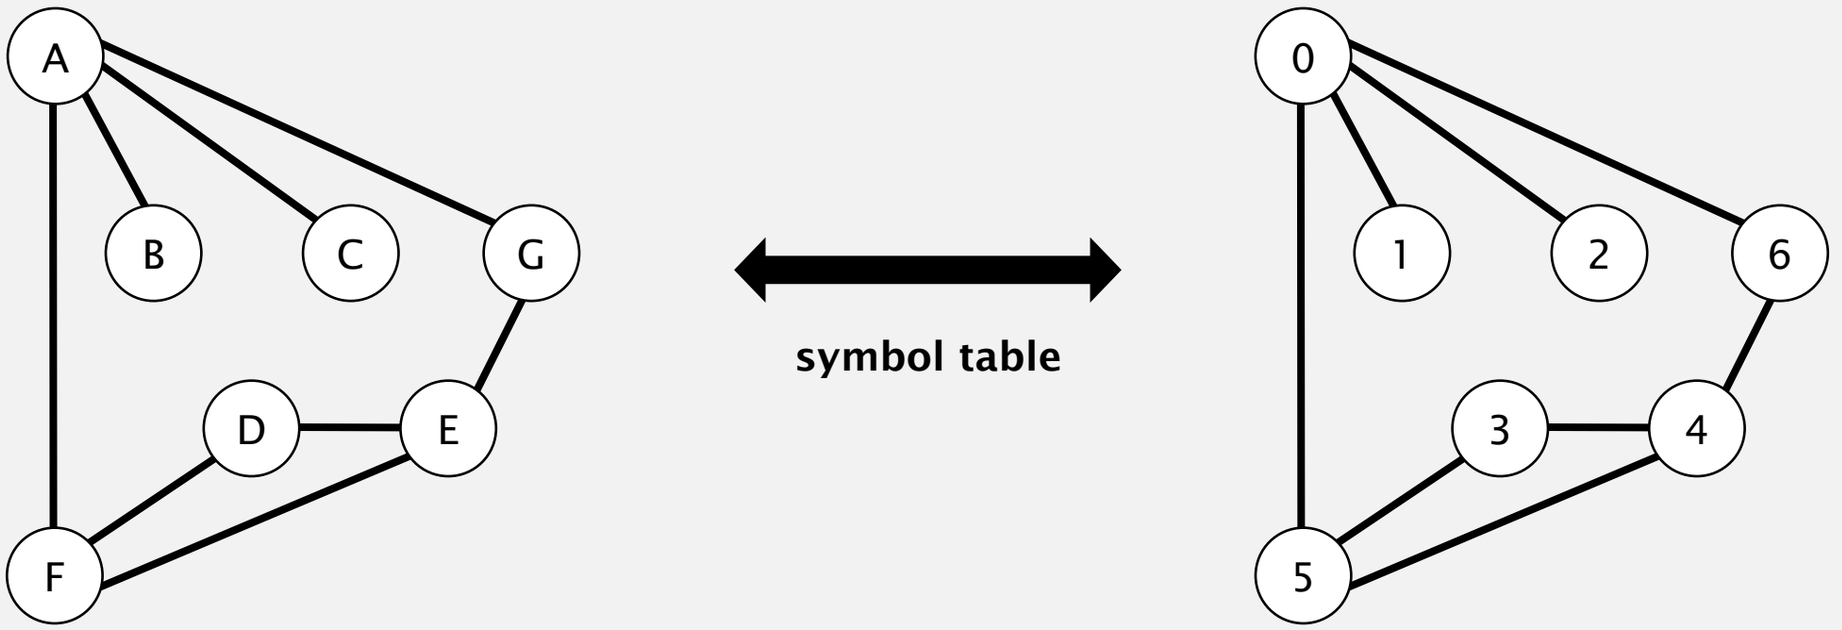
two drawings of the same graph

Caveat. Intuition can be misleading.

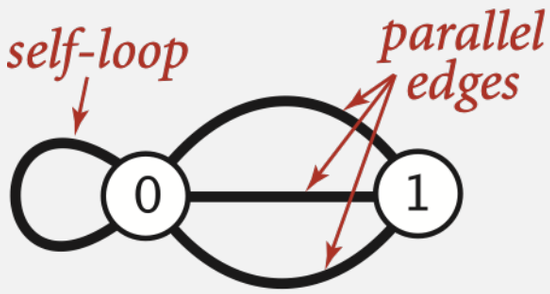
Graph representation

Vertex representation.

- This lecture: use integers between 0 and $V - 1$.
- Applications: convert between names and integers with symbol table.



Anomalies.



Graph API

public class Graph

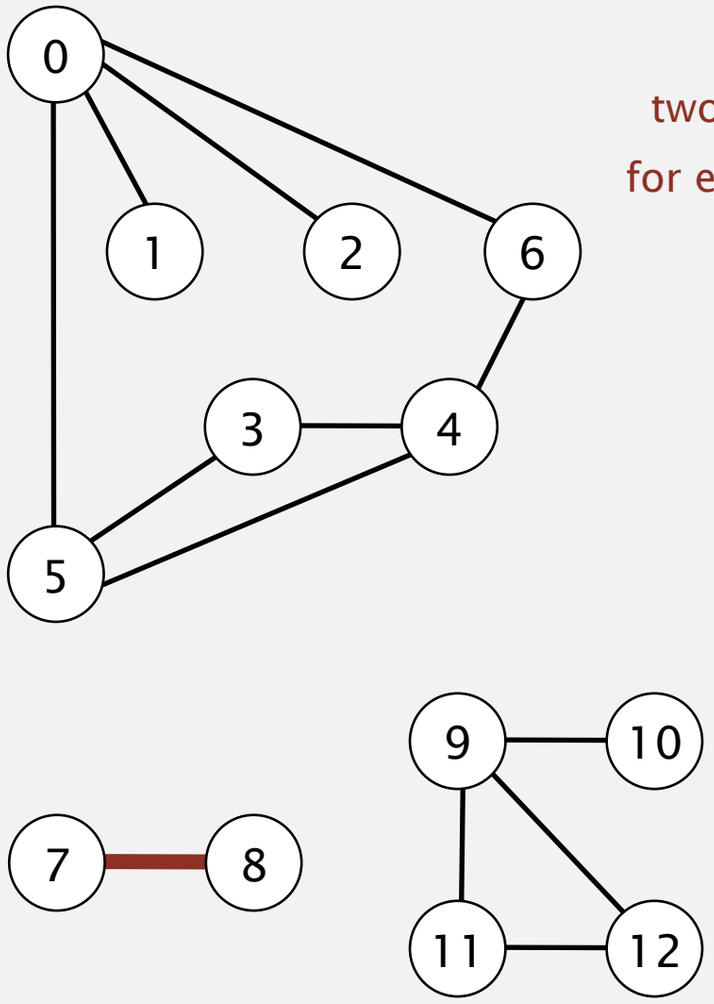
	Graph(int V)	*create an empty graph with V vertices*
	Graph(In in)	*create a graph from input stream*
void	addEdge(int v, int w)	*add an edge v–w*
Iterable<Integer>	adj(int v)	*vertices adjacent to v*
int	V()	*number of vertices*
int	E()	*number of edges*

```
// degree of vertex v in graph G
public static int degree(Graph G, int v)
{
   int degree = 0;
   for (int w : G.adj(v))
      degree++;
   return degree;
}
```

Graph representation: adjacency matrix

Maintain a two-dimensional V-by-V boolean array;

for each edge v–w in graph: adj[v][w] = adj[w][v] = true.



two entries for each edge

	0	1	2	3	4	5	6	7	8	9	10	11	12
0	0	1	1	0	0	1	1	0	0	0	0	0	0
1	1	0	0	0	0	0	0	0	0	0	0	0	0
2	1	0	0	0	0	0	0	0	0	0	0	0	0
3	0	0	0	0	1	1	0	0	0	0	0	0	0
4	0	0	0	1	0	1	1	0	0	0	0	0	0
5	1	0	0	1	1	0	0	0	0	0	0	0	0
6	1	0	0	0	1	0	0	0	0	0	0	0	0
7	0	0	0	0	0	0	0	0	1	0	0	0	0
8	0	0	0	0	0	0	0	1	0	0	0	0	0
9	0	0	0	0	0	0	0	0	0	0	1	1	1

11	0	0	0	0	0	0	0	0	0	1	0	0	1
12	0	0	0	0	0	0	0	0	0	1	0	1	0

Space consumption: V^2

Undirected graphs: quiz 2

Which is order of growth of running time of the following code fragment if the graph uses the adjacency-matrix representation, where V is the number of vertices and E is the number of edges?

```
for (int v = 0; v < G.V(); v++)
   for (int w : G.adj(v))
      StdOut.println(v + "-" + w);
```

print each edge twice

A. V

B. $E + V$

C. V^2

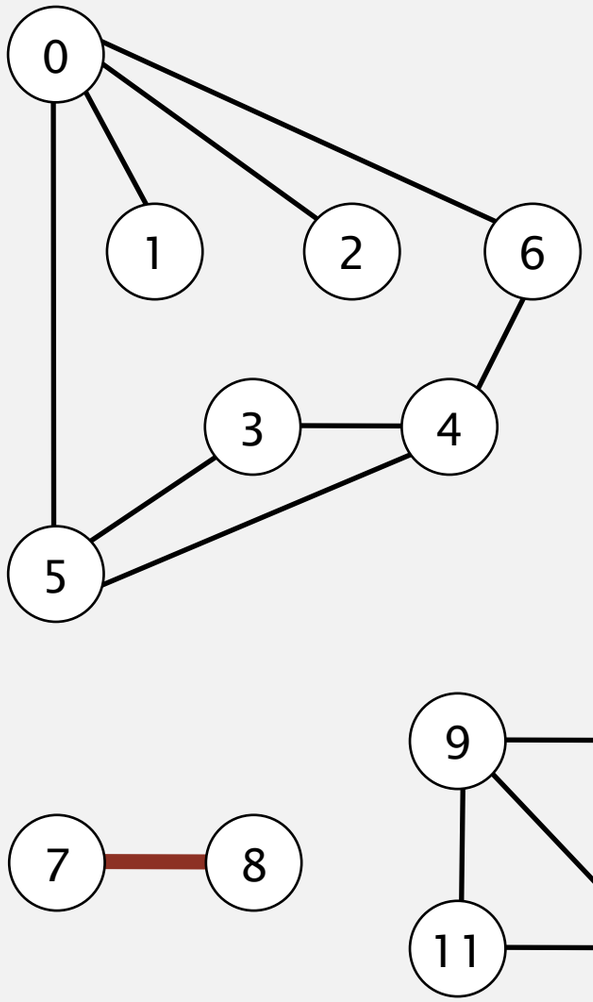
D. $V E$

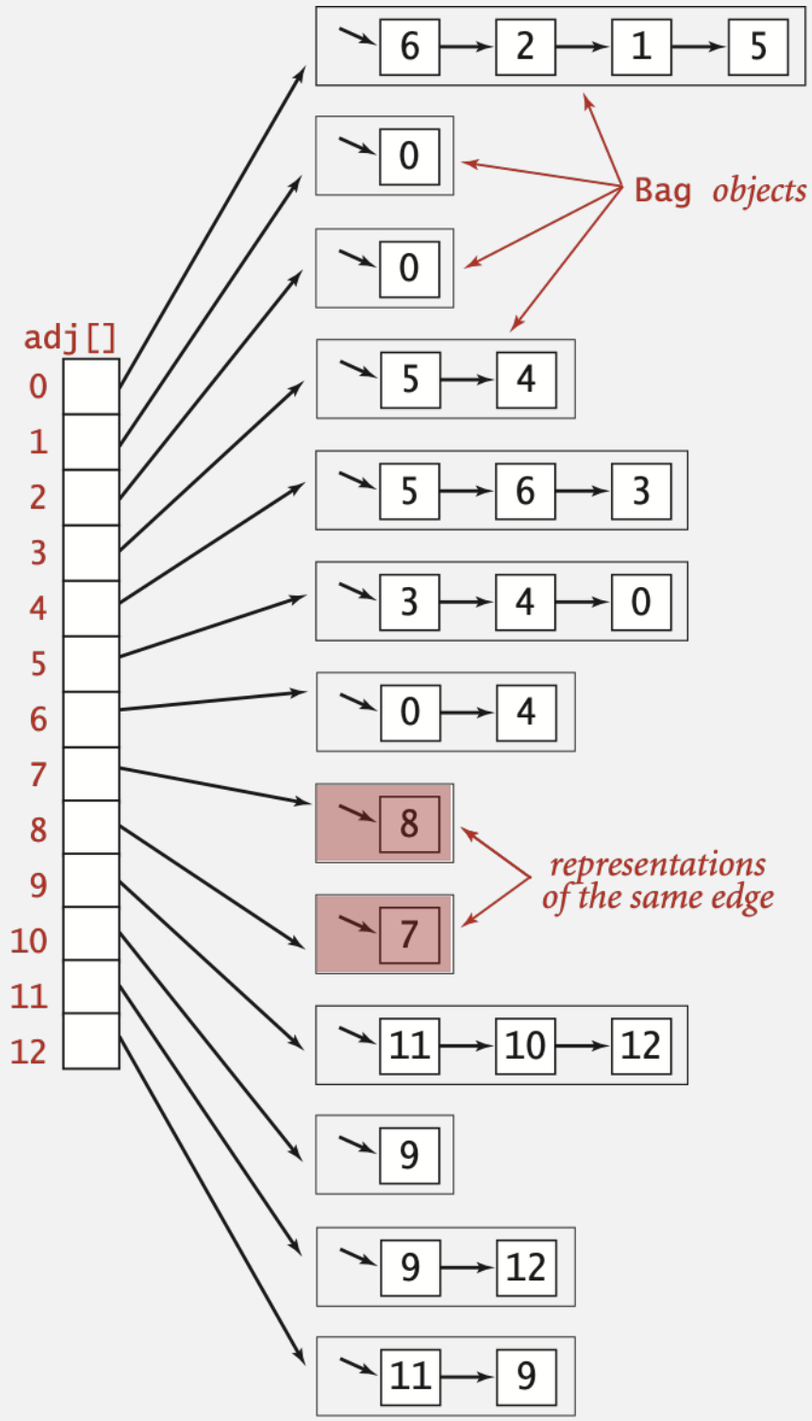
	0	1	2	3	4	5	6	7
0	0	1	1	0	0	1	1	0
1	1	0	0	0	0	0	0	0
2	1	0	0	0	0	0	0	0
3	0	0	0	0	1	1	0	0
4	0	0	0	1	0	1	1	0
5	1	0	0	1	1	0	0	0
6	1	0	0	0	1	0	0	0
7	0	0	0	0	0	0	0	0

adjacency-matrix representation

Graph representation: adjacency lists

Maintain vertex-indexed array of lists.





Assuming a linked list to store the adjacency list.

Space consumption: **V + (2E) * 2** ← each edge is stored twice.

2 units per node: the vertex and the next pointer.

Undirected graphs: quiz 3

Which is order of growth of running time of the following code fragment if the graph uses the adjacency-lists representation, where V is the number of vertices and E is the number of edges?

```
for (int v = 0; v < G.V(); v++)
   for (int w : G.adj(v))
      StdOut.println(v + "-" + w);
```

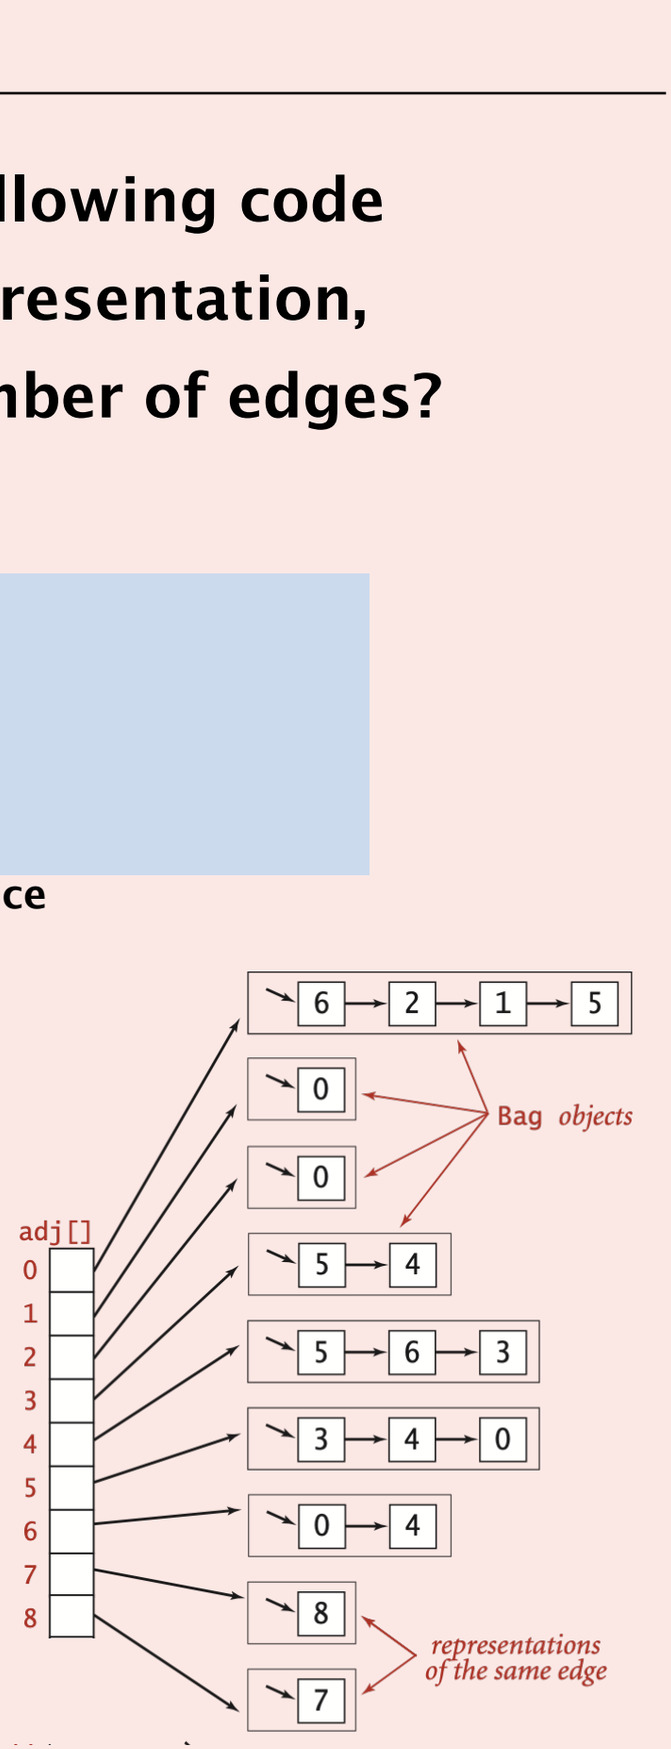
print each edge twice

A. V

B. $E + V$

C. V^2

D. $V E$



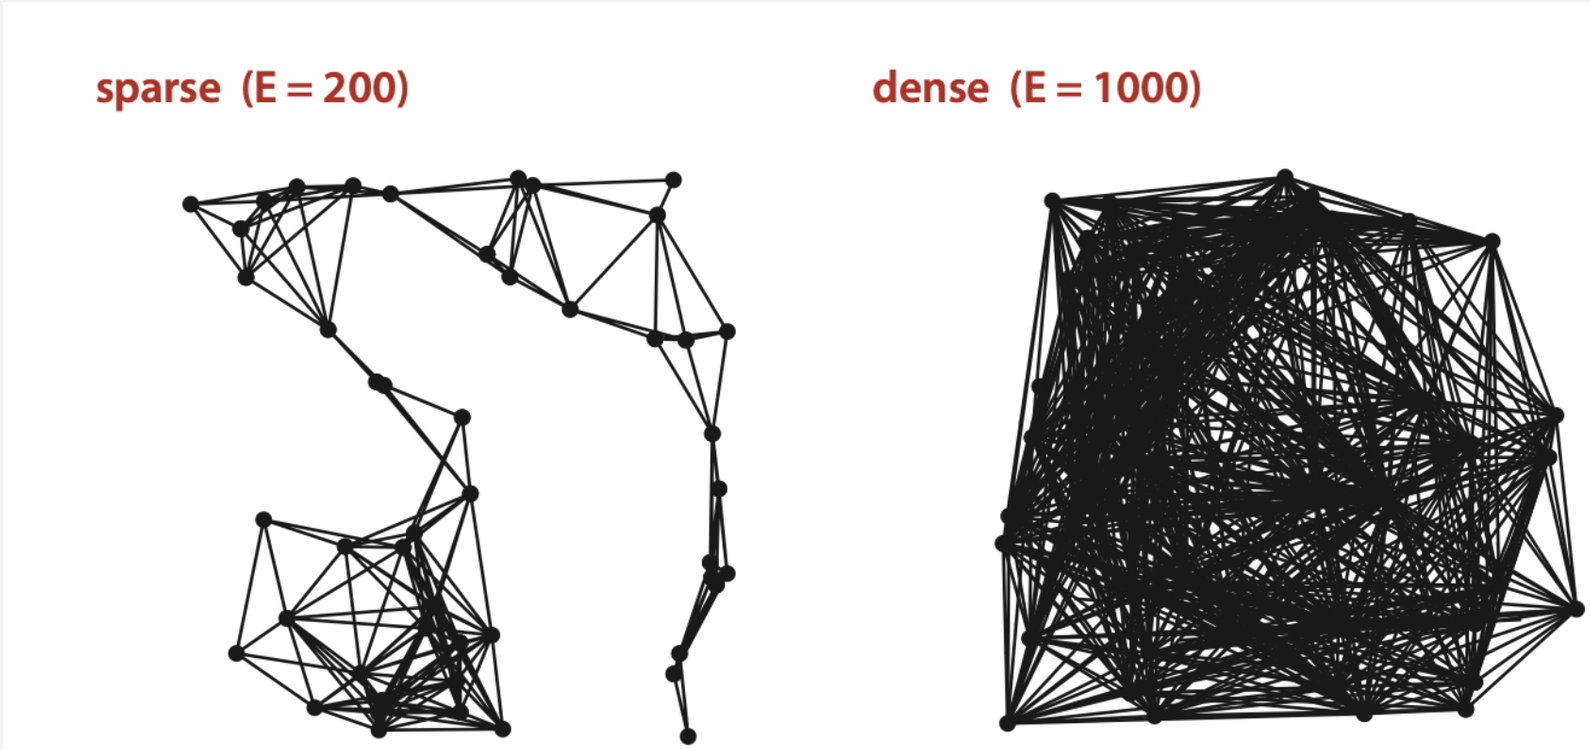
Graph representations

In practice. Use adjacency-lists representation.

- Algorithms based on iterating over vertices adjacent to v.
- Real-world graphs tend to be sparse (not dense).

proportional to V edges

proportional to V^2 edges



Two graphs (V = 50)

Graph representations

In practice. Use adjacency-lists representation.

- Algorithms based on iterating over vertices adjacent to v.
- Real-world graphs tend to be sparse (not dense).

representation	space	add edge	edge between v and w?	iterate over vertices adjacent to v?
list of edges	E	1	E	E
adjacency matrix	V^2	1 †	1	V
adjacency lists	$E + V$	1	$degree(v)$	$degree(v)$

† disallows parallel edges

Adjacency-list graph representation: Java implementation

LO 9A.7

```
public class Graph
{
   private final int V;
   private Bag<Integer>[] adj;

   public Graph(int V)
   {
     this.V = V;
     adj = (Bag<Integer>[]) new Bag[V];
     for (int v = 0; v < V; v++)
        adj[v] = new Bag<Integer>();
   }

   public void addEdge(int v, int w)
   {
     adj[v].add(w);
     adj[w].add(v);
   }

   public Iterable<Integer> adj(int v)
   {  return adj[v];  }
}
```

adjacency lists (using Bag data type)

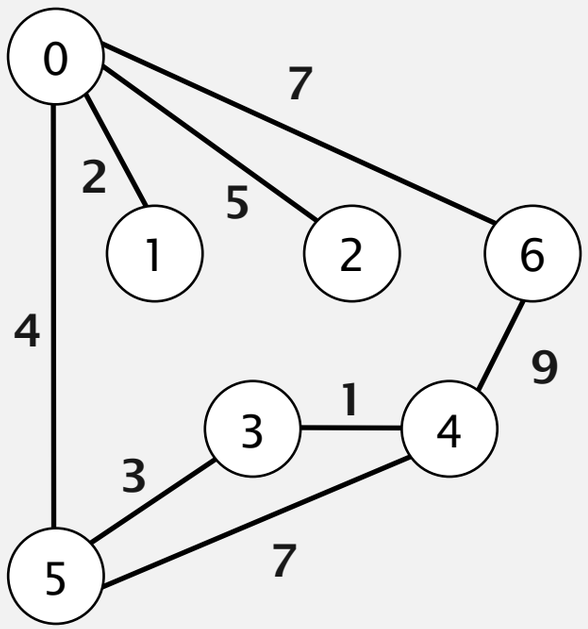
create empty graph with V vertices

add edge v-w (parallel edges and self-loops allowed)

iterator for vertices adjacent to v

Weighted Undirected Graphs

Edges have a cost associated with them.



The cost of path 0, 6, 4 is 16

The cost of path 0, 5, 4 is 11

The cost of path 0, 5, 3, 4 is 8

Graph representation: adjacency matrix

Maintain a two-dimensional V-by-V array;

for each edge v–w in graph: adj[v][w] = adj[w][v] = **edge cost or value**.

	0	1	2	3	4	5	6	7	8	9	10	11	12
0	0	2	5	0	0	4	7	0	0	0	0	0	0

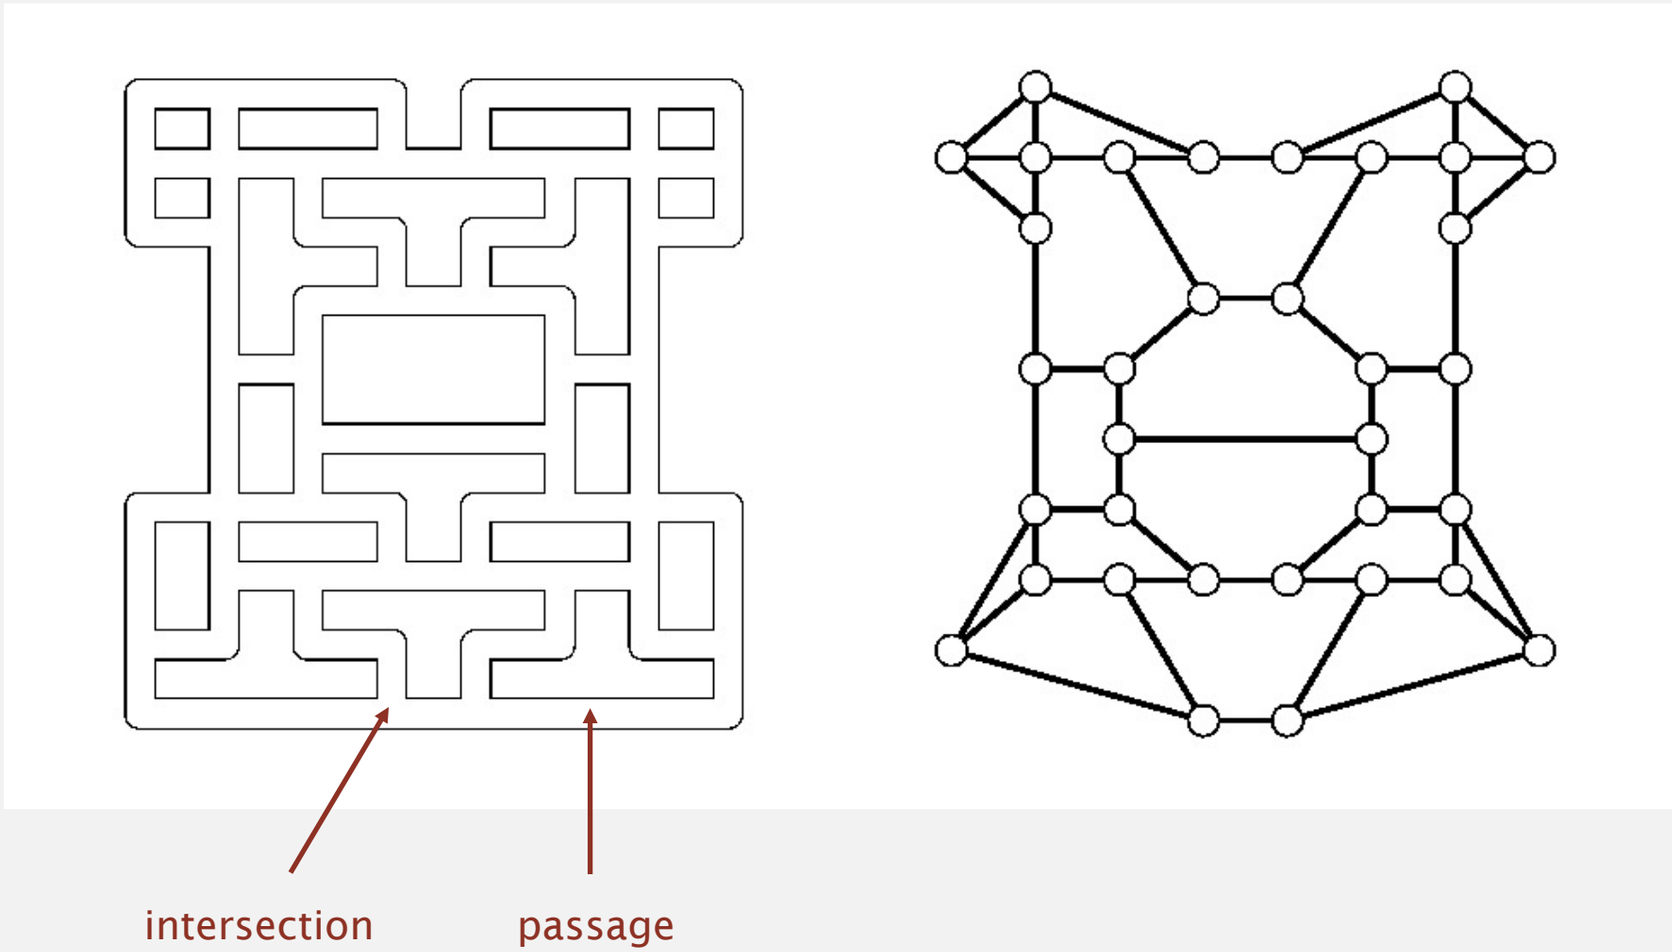
Maze exploration

Maze graph.

- Vertex = intersection.
- Edge = passage.



Goal. Explore every intersection in the maze.

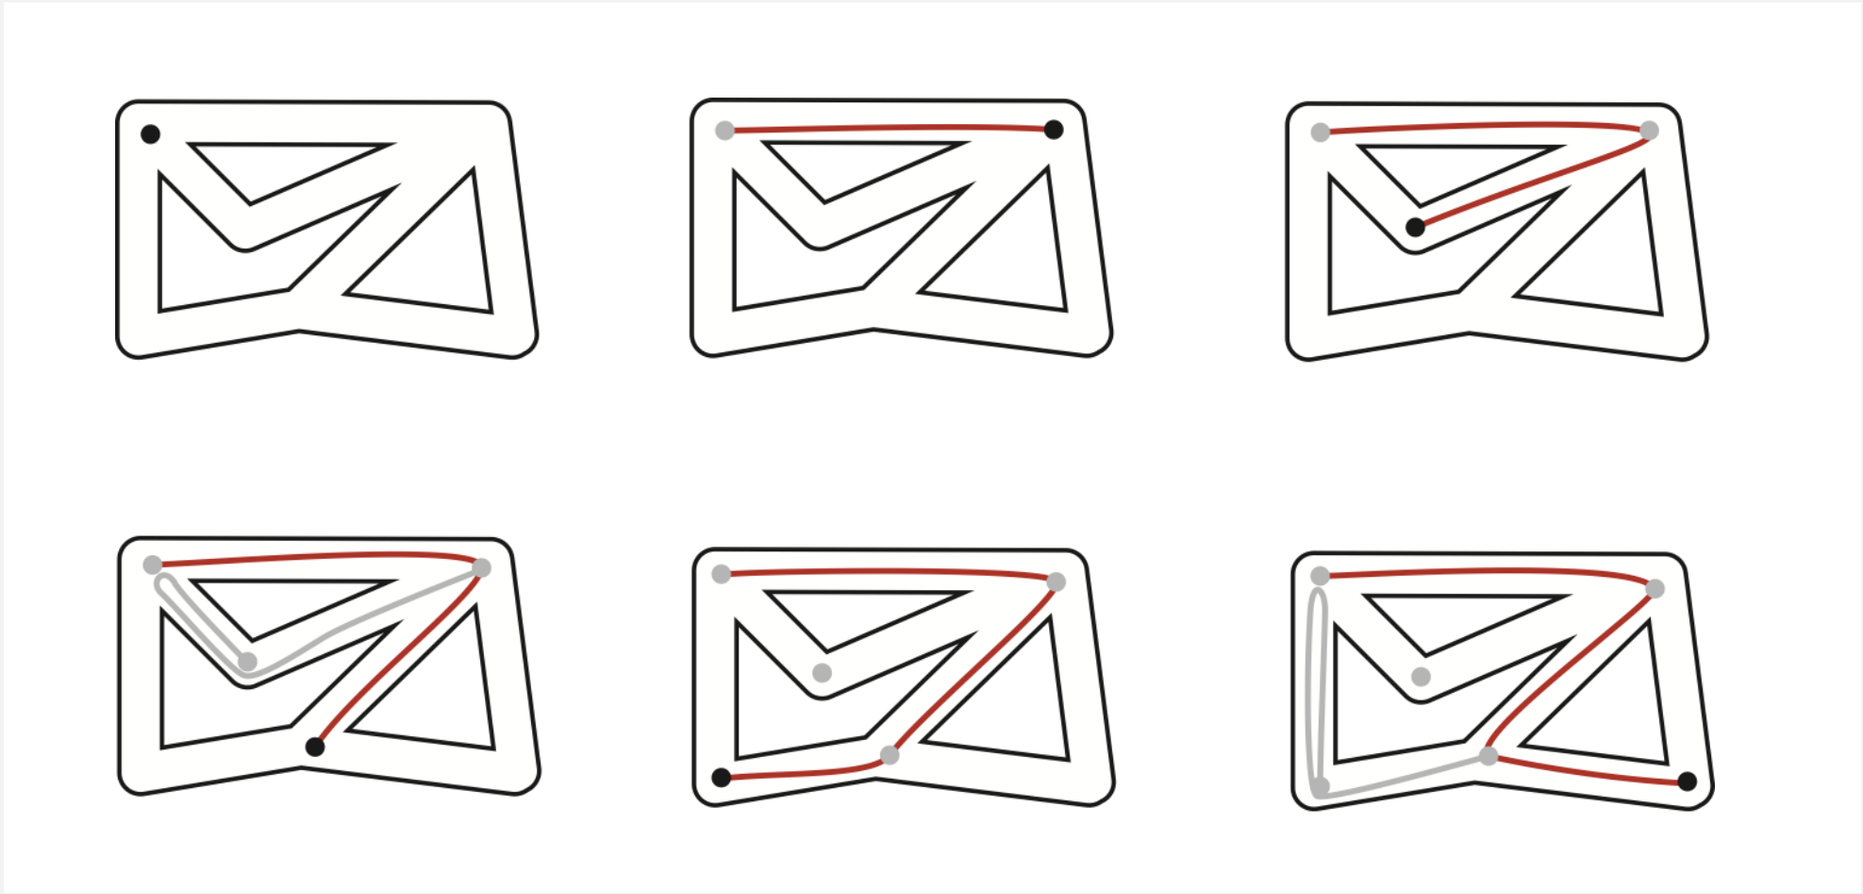
Maze exploration: National Building Museum

http://www.smithsonianmag.com/travel/winding-history-maze-180951998/?no-ist

Trémaux maze exploration

Algorithm.

- Unroll a ball of string behind you.
- Mark each newly discovered intersection and passage.
- Retrace steps when no unmarked options.



Trémaux maze exploration

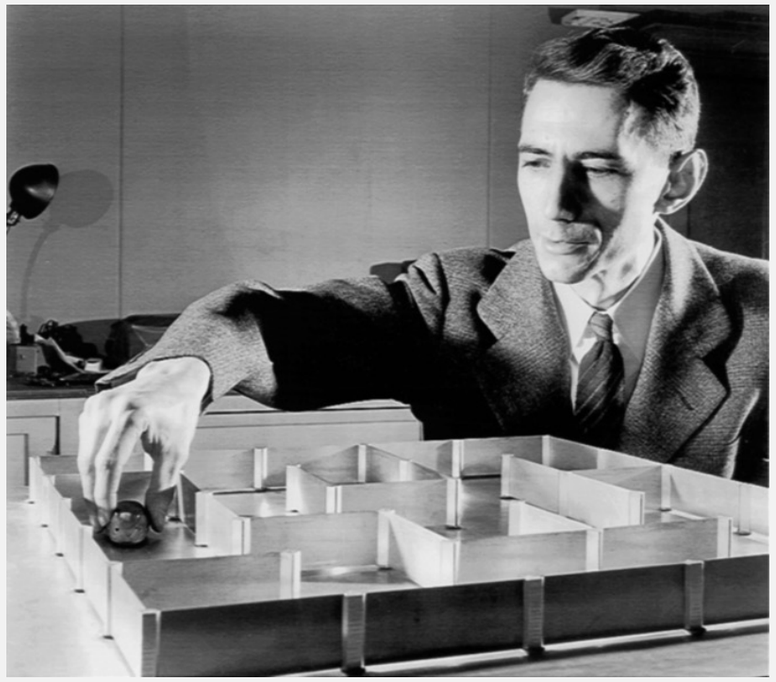
Algorithm.

- Unroll a ball of string behind you.
- Mark each newly discovered intersection and passage.
- Retrace steps when no unmarked options.

First use? Theseus entered Labyrinth to kill the monstrous Minotaur; Ariadne instructed Theseus to use a ball of string to find his way back out.

The Cretan Labyrinth (with Minotaur)

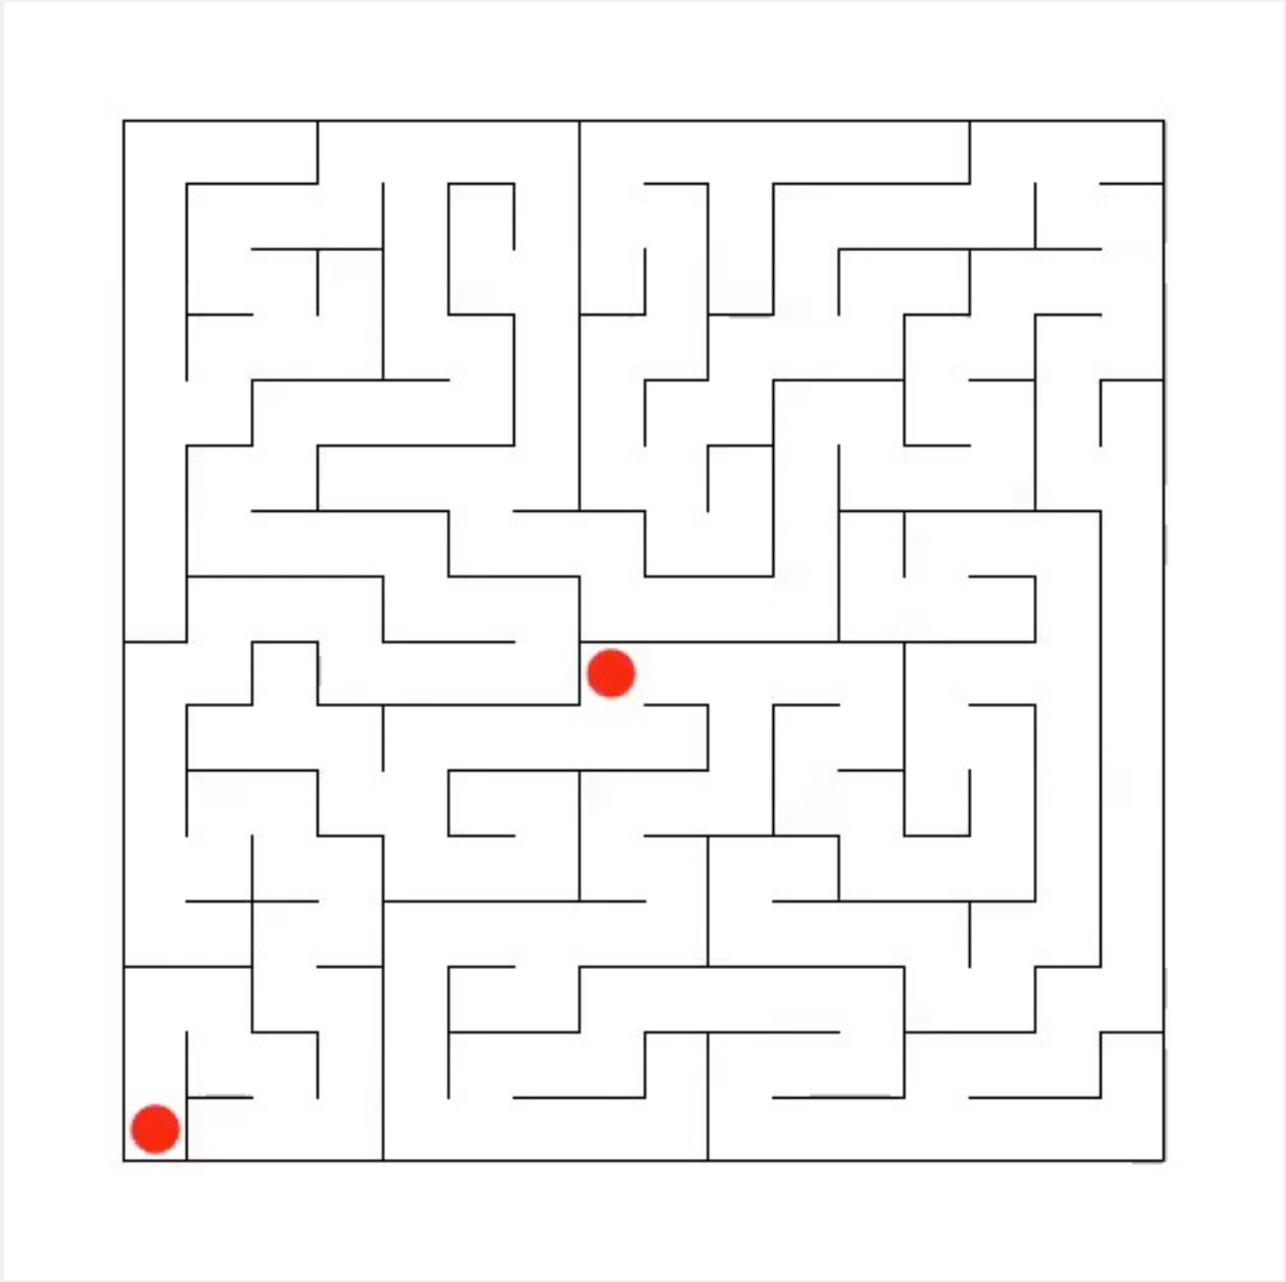
http://commons.wikimedia.org/wiki/File:Minotaurus.gif



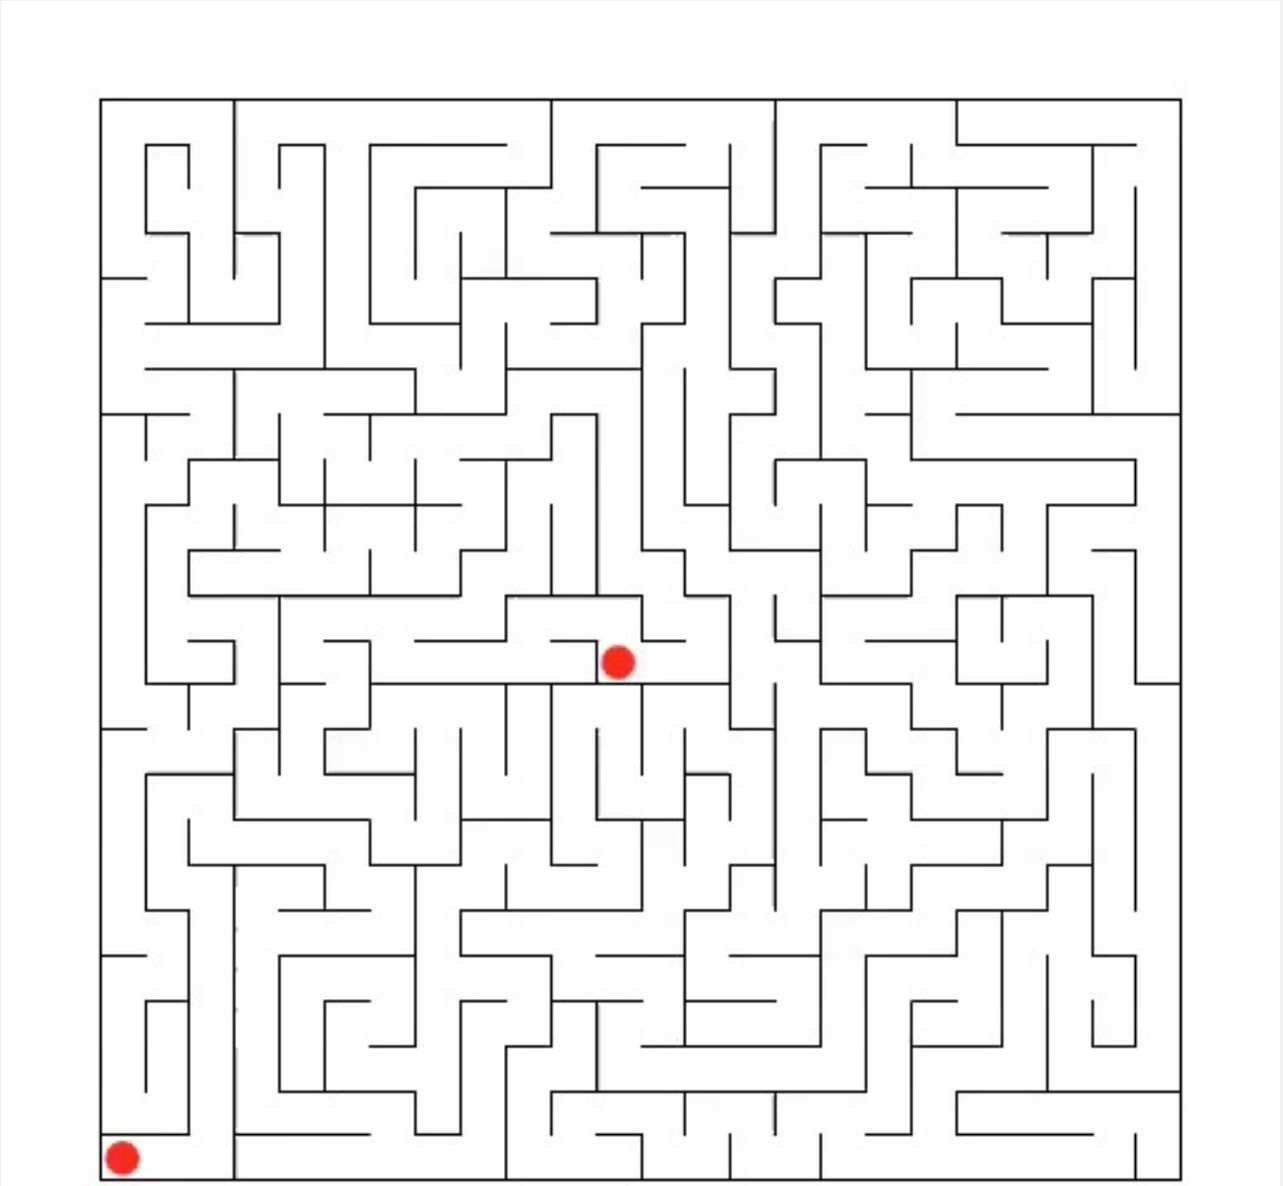
Claude Shannon (with electromechanical mouse)

http://www.corp.att.com/attlabs/reputation/timeline/16shannon.html

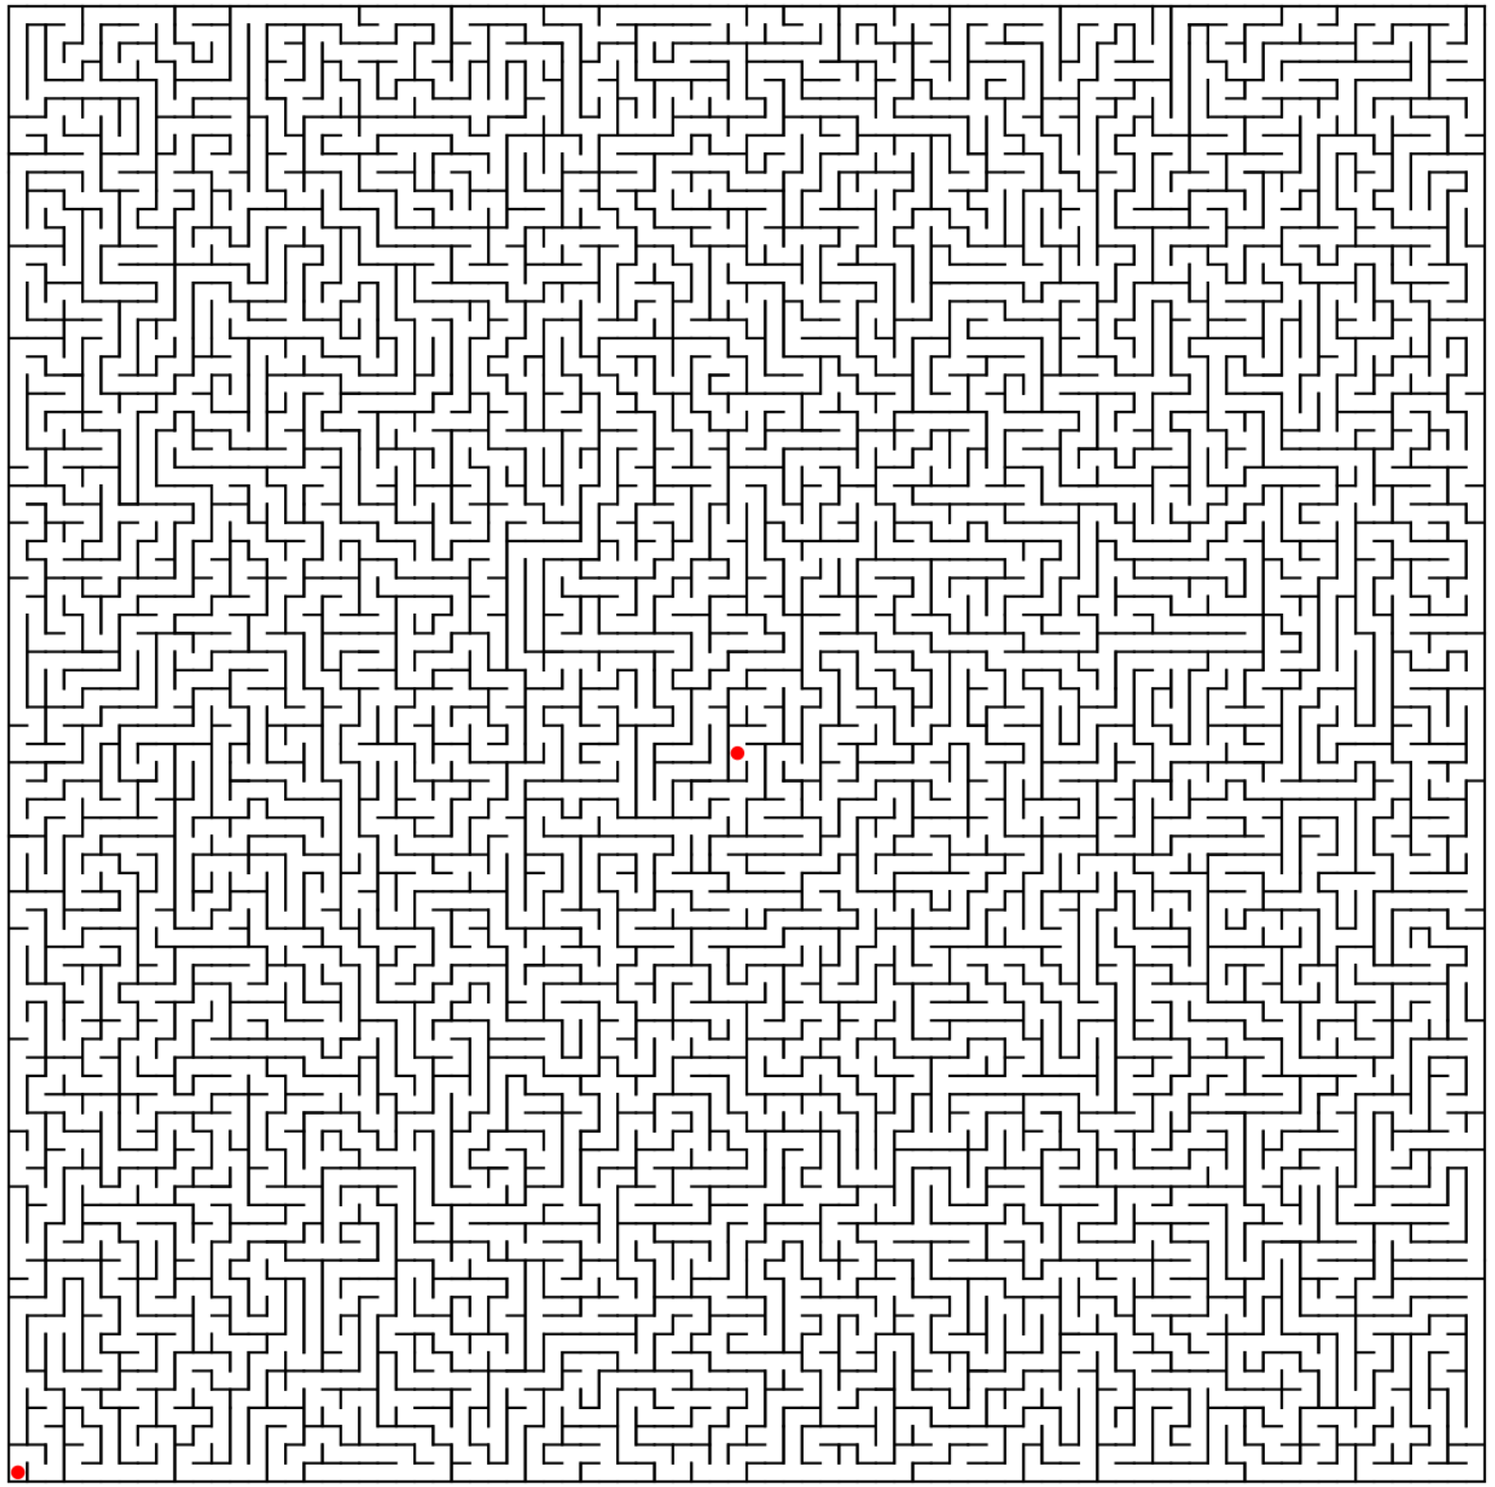
Maze exploration: easy



Maze exploration: medium



Maze exploration: challenge for the bored



Depth-first search

Goal. Systematically traverse a graph.

Idea. Mimic maze exploration. ← function-call stack plays role of ball of string

DFS (to visit a vertex v)

Mark vertex v.

Recursively visit all unmarked vertices w adjacent to v.

Typical applications.

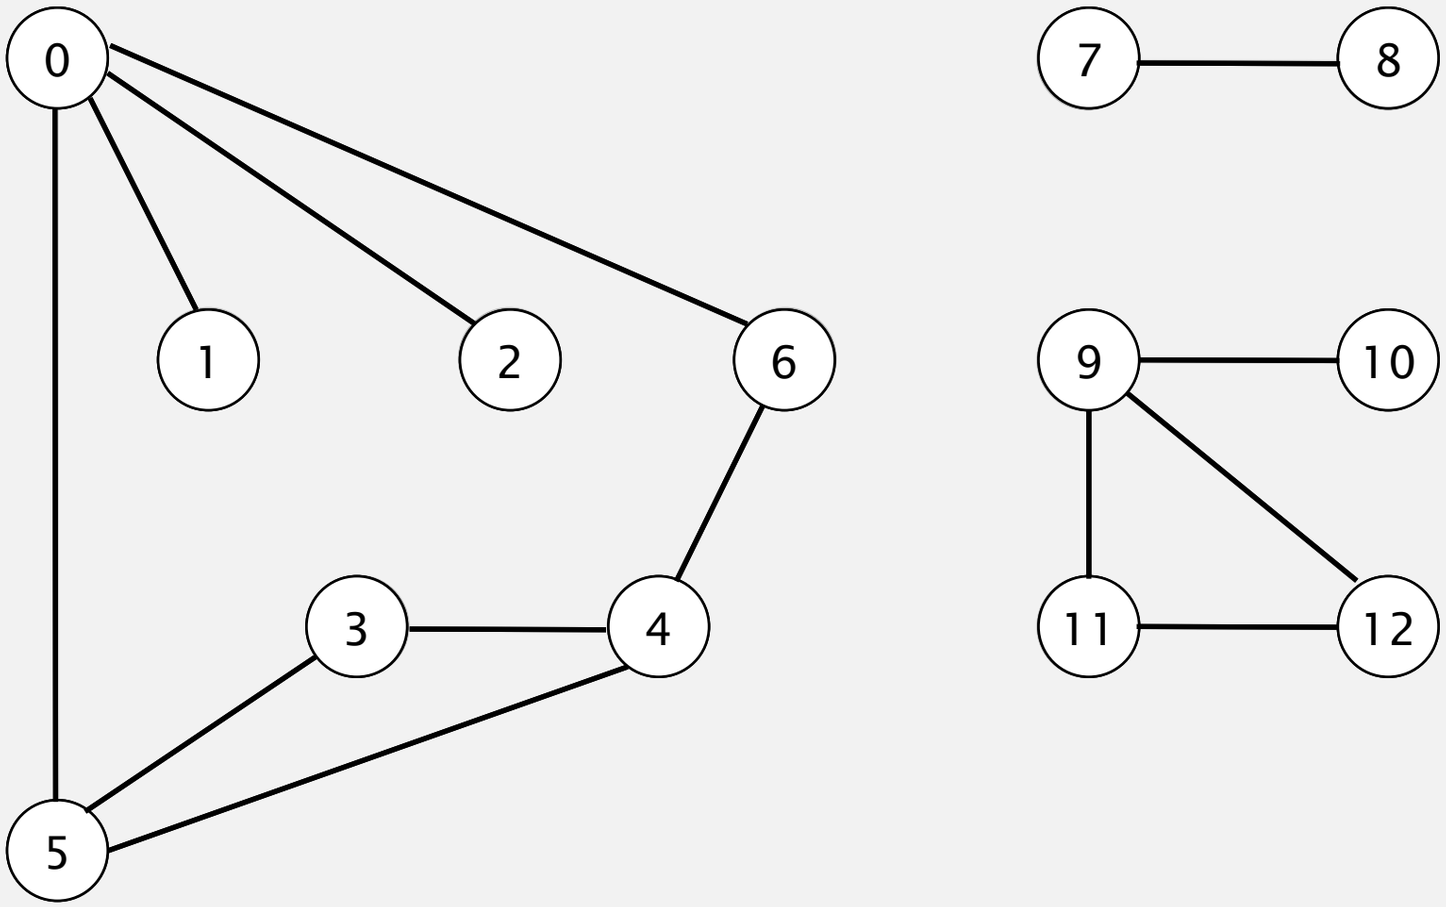
- Find all vertices connected to a given source vertex.
- Find a path between two vertices.

Design challenge. How to implement?

Depth-first search demo

To visit a vertex v :

- Mark vertex v.
- Recursively visit all unmarked vertices adjacent to v.



graph G

vertices reachable from 0

Design pattern for graph processing

Design pattern. Decouple graph data type from graph processing.

- Create a Graph object.
- Pass the Graph to a graph-processing routine.
- Query the graph-processing routine for information.

public class Paths

	Paths(Graph G, int s)	*find paths in G from source s*
boolean	hasPathTo(int v)	*is there a path from s to v?*
Iterable<Integer>	pathTo(int v)	*path from s to v; null if no such path*

```
Paths paths = new Paths(G, s);
for (int v = 0; v < G.V(); v++)
   if (paths.hasPathTo(v))
      StdOut.println(v);
```

print all vertices connected to s

Depth-first search: data structures

To visit a vertex v :

- Mark vertex v.
- Recursively visit all unmarked vertices adjacent to v.

Data structures.

- Boolean array marked[] to mark vertices.
- Integer array edgeTo[] to keep track of paths.

  (edgeTo[w] == v) means that edge v-w taken to discover vertex w
- Function-call stack for recursion.

Depth-first search: Java implementation

```
public class DepthFirstPaths
{

  private boolean[] marked;
  private int[] edgeTo;
  private int s;

  public DepthFirstPaths(Graph G, int s)
  {
    ...
    dfs(G, s);
  }

  private void dfs(Graph G, int v)
  {
    marked[v] = true;
    for (int w : G.adj(v))
      if (!marked[w])
      {
        edgeTo[w] = v;
        dfs(G, w);
      }
  }

}
```

marked[v] = true

if v connected to s
edgeTo[v] = previous vertex

on path from s to v

initialize data structures

find vertices connected to s

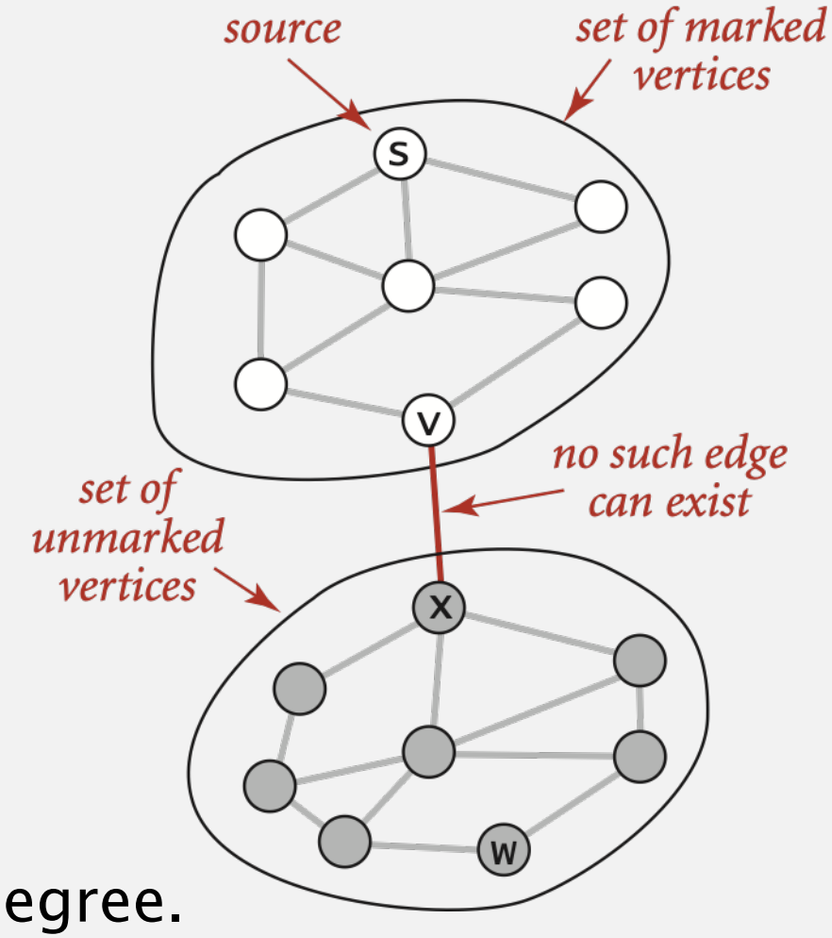
recursive DFS does the work

Depth-first search: properties

Proposition. DFS marks all vertices connected to s in time proportional to the sum of their degrees (plus time to initialize the marked[] array).

Pf. [correctness]

- If w marked, then w connected to s (why?)
- If w connected to s, then w marked.
  (if w unmarked, then consider last edge on a path from s to w that goes from a marked vertex to an unmarked one).



Pf. [running time]

- Each vertex connected to s is visited once.
- Visiting a vertex takes time proportional to its degree.

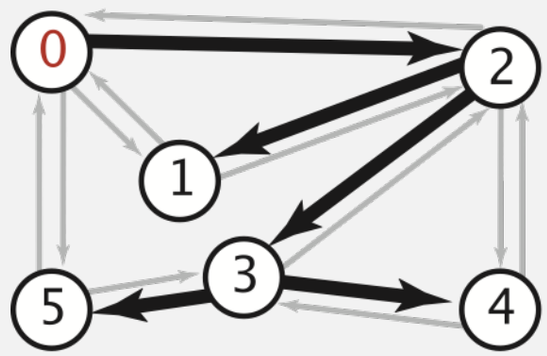
Depth-first search: properties

Proposition. After DFS, can check if vertex v is connected to s in constant time and can find v–s path (if one exists) in time proportional to its length.

Pf. edgeTo[] is parent-link representation of a tree rooted at vertex s.

```
public boolean hasPathTo(int v)
{  return marked[v];  }

public Iterable<Integer> pathTo(int v)
{
   if (!hasPathTo(v)) return null;
   Stack<Integer> path = new Stack<Integer>();
   for (int x = v; x != s; x = edgeTo[x])
      path.push(x);
   path.push(s);
   return path;
}
```



edgeTo[]

0	
1	2
2	0
3	2
4	3
5	3

Flood Fill

Problem. Implement flood fill (Photoshop magic wand).

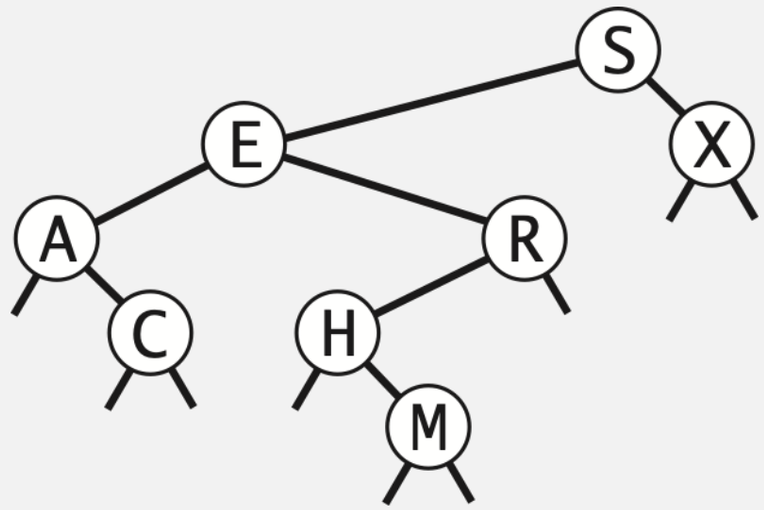
UNDIRECTED GRAPHS

- *introduction*
- *graph API*
- *depth-first search*
- *breadth-first search*
- *challenges*

Graph search

Tree traversal. Many ways to explore every vertex in a binary tree.

- Inorder: A C E H M R S X
- Preorder: S E A C R H M X
- Postorder: C A M H R E X S
- Level-order: S E X A R C H M



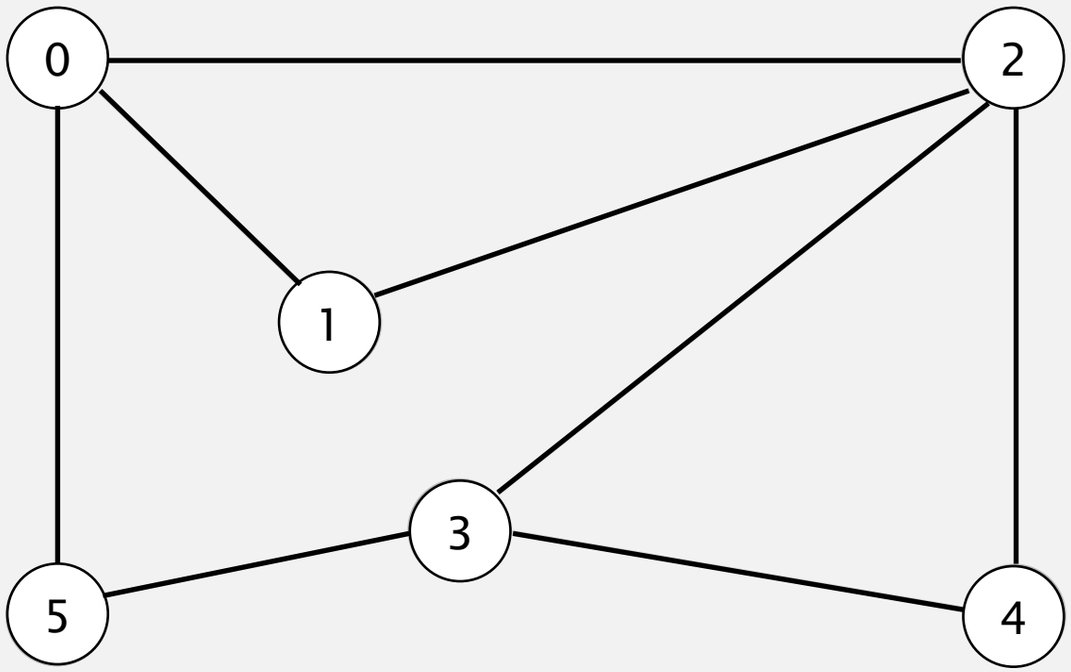
Graph search. Many ways to explore every vertex in a graph.

- Preorder: vertices in order of calls to dfs(G, v).
- Postorder: vertices in order of returns from dfs(G, v).
- Level-order: vertices in increasing order of distance from s.

Breadth-first search demo

Repeat until queue is empty:

- Remove vertex v from queue.
- Add to queue all unmarked vertices adjacent to v and mark them.



graph G

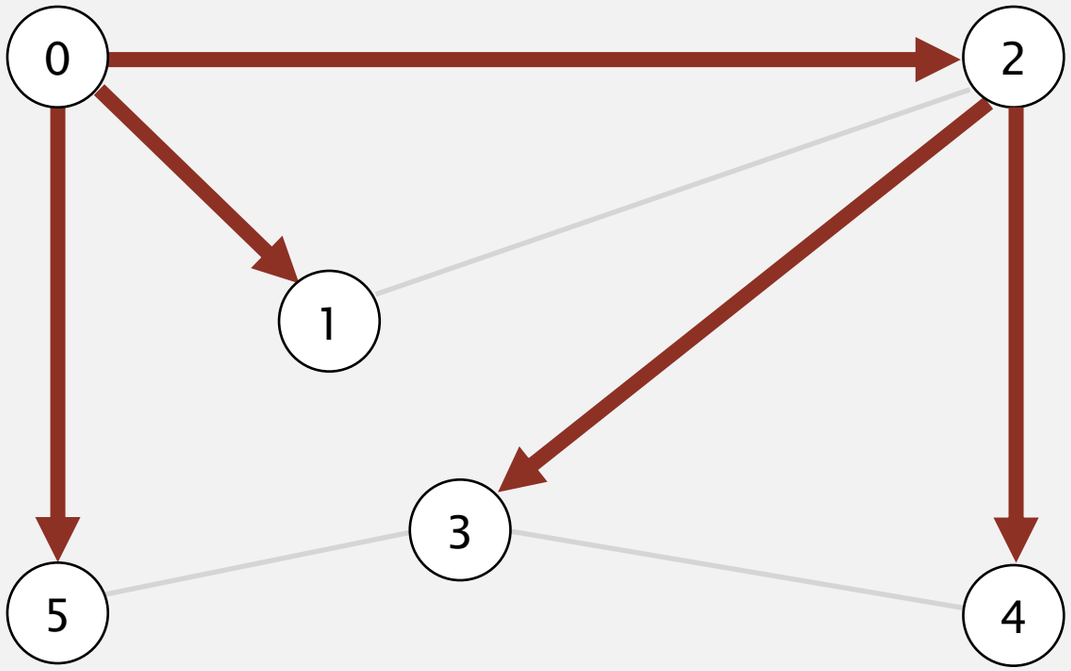
tinyCG.txt

```
V
6
8   E
0 5
2 4
2 3
1 2
0 1
3 4
3 5
0 2
```

Breadth-first search demo

Repeat until queue is empty:

- Remove vertex v from queue.
- Add to queue all unmarked vertices adjacent to v and mark them.



v	edgeTo[]	distTo[]
0	-	0
1	0	1
2	0	1
3	2	2
4	2	2
5	0	1

done

Breadth-first search

Repeat until queue is empty:

- Remove vertex v from queue.
- Add to queue all unmarked vertices adjacent to v and mark them.

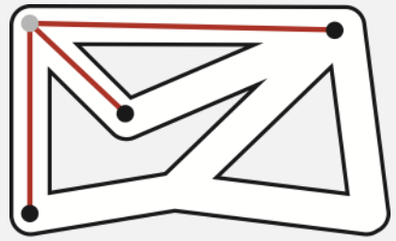
BFS (from source vertex s)

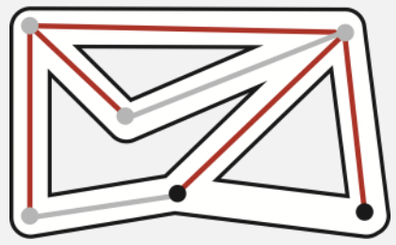
Put s onto a FIFO queue, and mark s as visited.

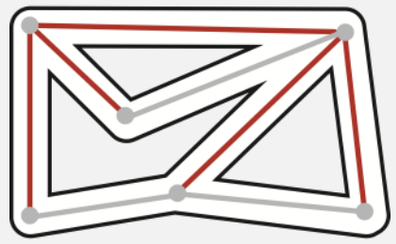
Repeat until the queue is empty:

- remove the least recently added vertex v

- add each of v's unmarked neighbors to the queue, and mark them.







Breadth-first search: Java implementation

```
public class BreadthFirstPaths
{
   private boolean[] marked;
   private int[] edgeTo;
   private int[] distTo;

   private void bfs(Graph G, int s) {
      Queue<Integer> q = new Queue<Integer>();
      q.enqueue(s);
      marked[s] = true;
      distTo[s] = 0;

      while (!q.isEmpty()) {
         int v = q.dequeue();
         for (int w : G.adj(v)) {
            if (!marked[w]) {
               q.enqueue(w);
               marked[w] = true;
               edgeTo[w] = v;
               distTo[w] = distTo[v] + 1;
            }
         }
      }
   }
```

initialize FIFO queue of vertices to explore

found new vertex w via edge v–w

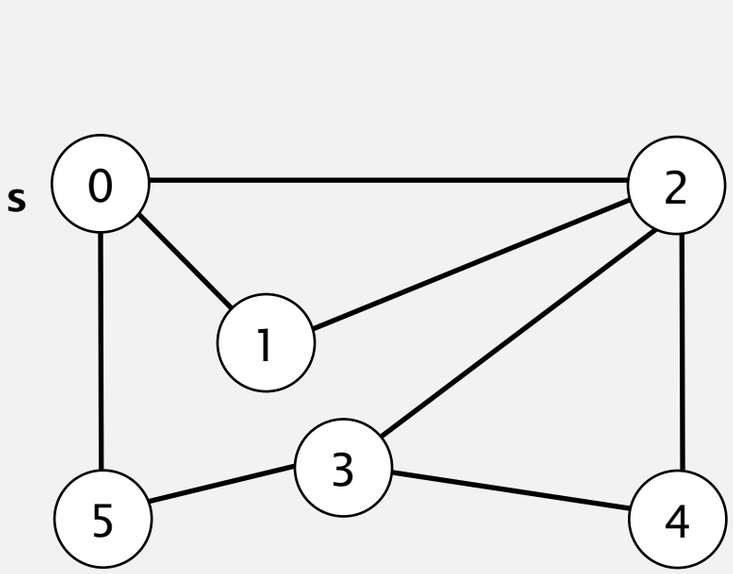
Breadth-first search properties

Q. In which order does BFS examine vertices?

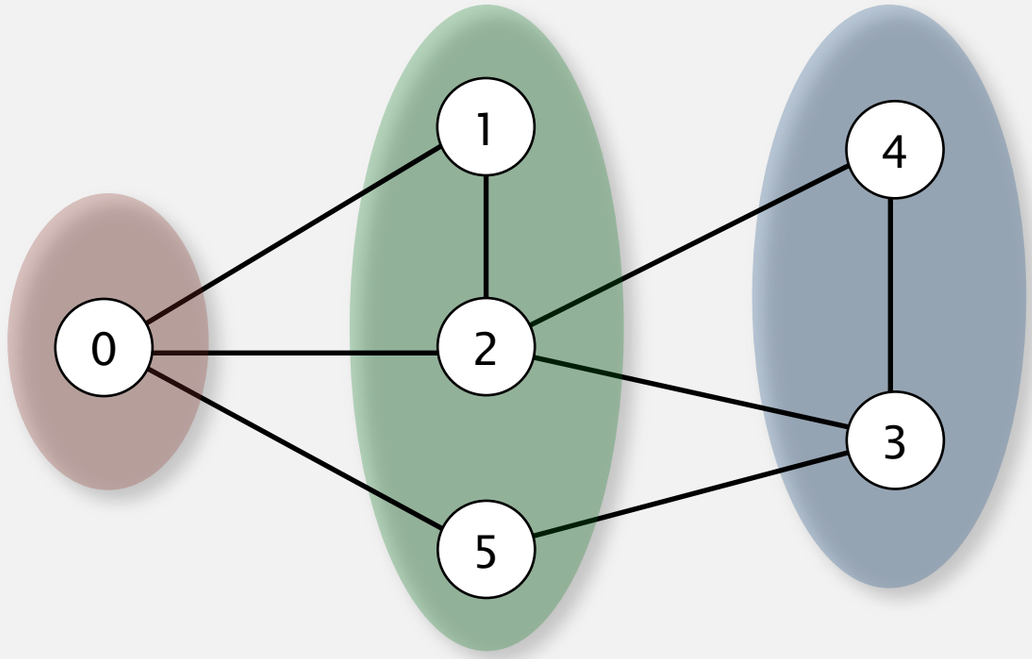
A. Increasing distance (number of edges) from s.

queue always consists of ≥ 0 vertices of distance k from s,
followed by ≥ 0 vertices of distance k+1

Proposition. In any connected graph G, BFS computes shortest paths from s to all other vertices in time proportional to $E + V$.



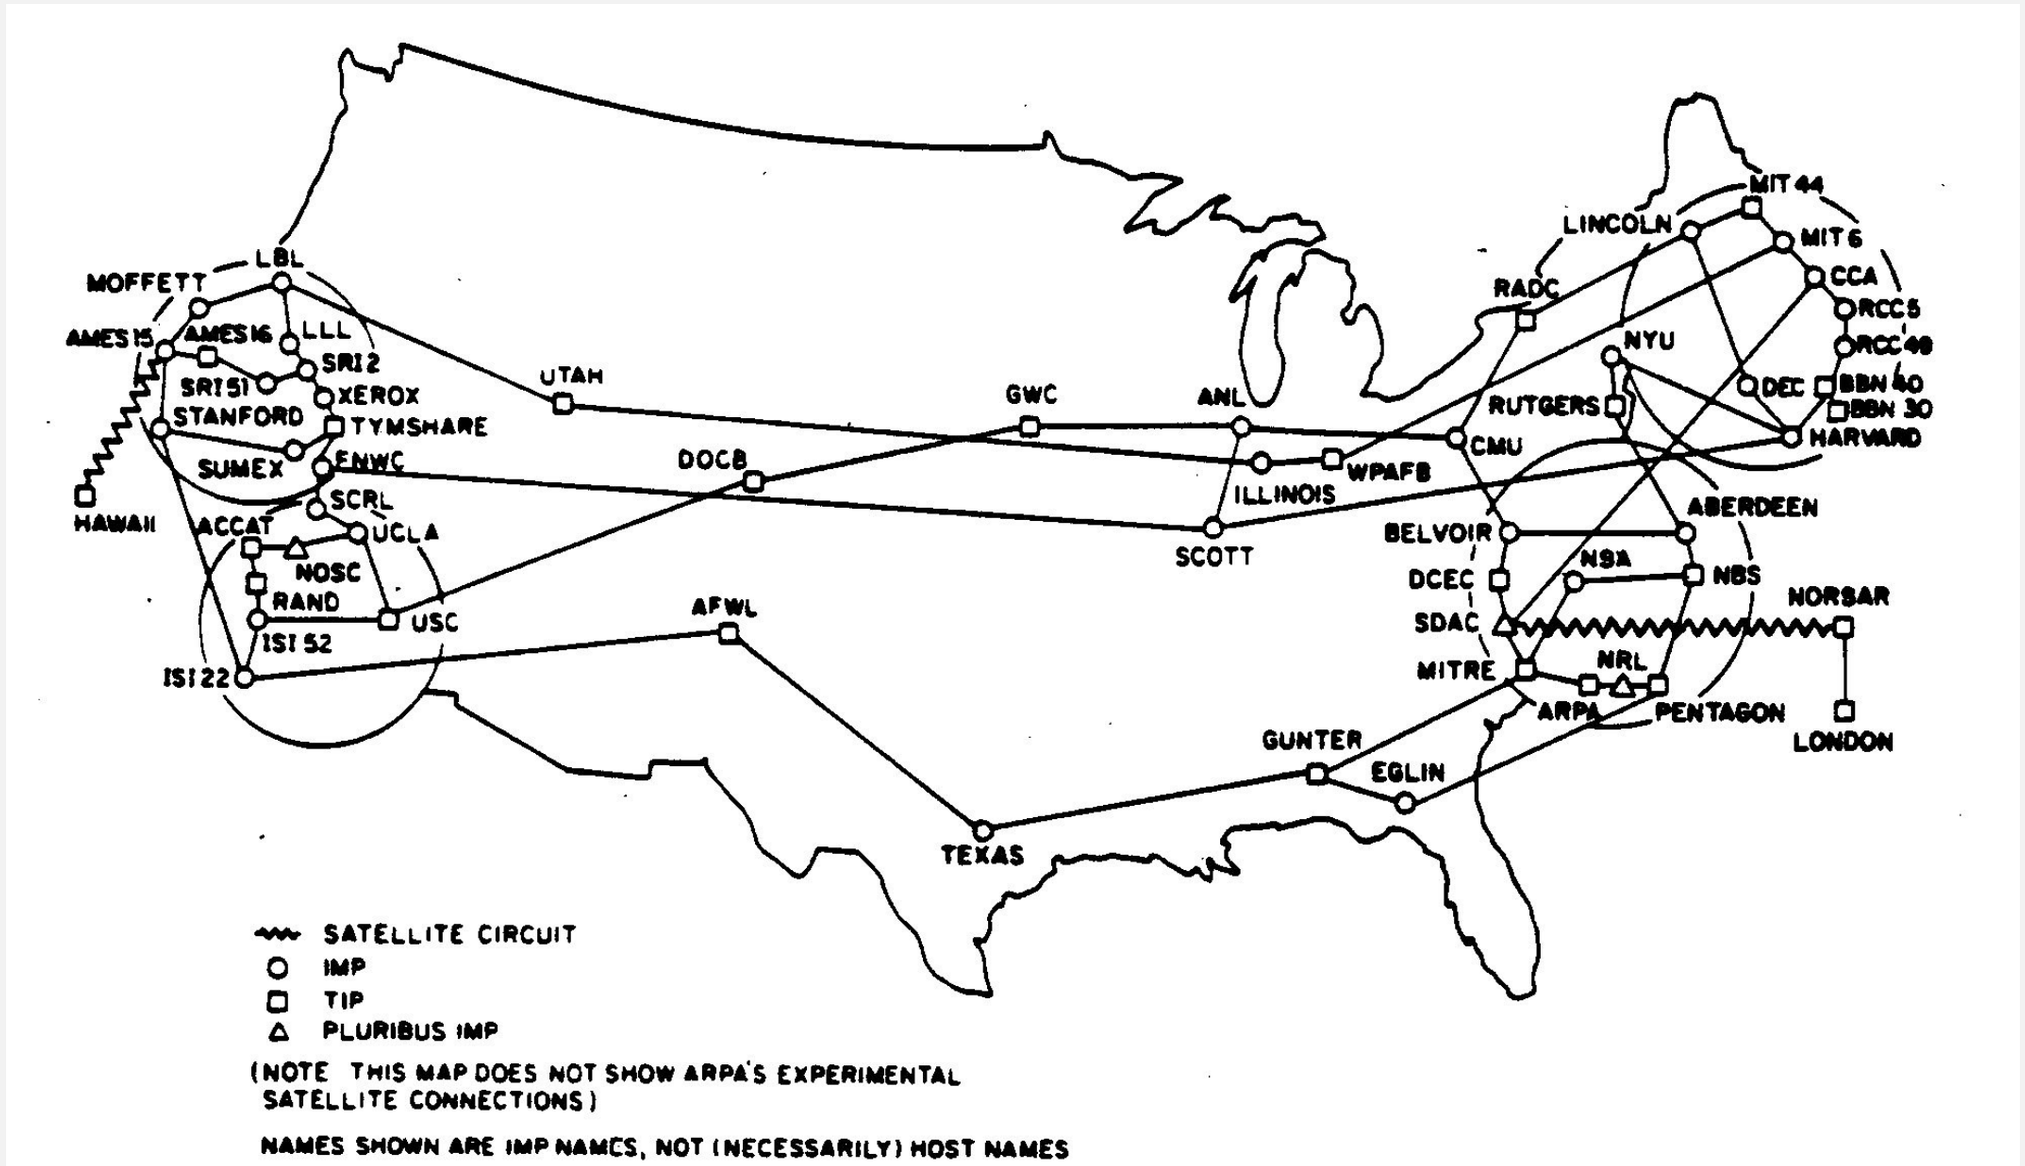
graph G



dist = 0 dist = 1 dist = 2

Breadth-first search application: routing

Fewest number of hops in a communication network.



ARPANET, July 1977

Breadth-first search application: Kevin Bacon numbers
